1. Turn-on Storage and Shutdown Storage

1.1. Turn-on Storage

Before you turn on your storage, please make sure that the storage is stably locked in your rank mount and the two power cords are setup in the rear panel of storage. Then, push the power switch in front of the storage, like ① of Fig. 1. The storage makes sound, “PI”. During booting of the storage, Ready LED, ② of Fig. 1, is twinkling until finishing storage boot process and Ready LED is sustained ON. Then, the storage can serve users or is waiting for initialization processes by the administrator.

Fig. 1 Turn-on the Storage

Fig. 1 Description:

- ① Power Switch of Storage
- ② Ready LED

1.2. Shutdown Storage

The storage provides three manners for shutting the storage down:

1. Push the Power Switch in front of the storage chassis, for example ① of Fig. 1.
2. Mouse clicks “Shutdown” in the left field of management UI.
3. Mouse clicks  in the Disk Status page of management UI.

The following describes the three manners.

1.2.1. Shutdown Storage by Power Switch

Push Power Switch in ① of Fig. 1. The Ready LED is twinkling during the shutdown process.

1.2.2. Shutdown Storage by Function List of UI

The storage provides shutting storage down by Web Management System. Administrator can shut the storage down through Internet. Please look for “Shutdown” in the left field of Web Management System, as shown in Fig. 2. In addition, click “Shutdown” to show shutdown page in right field on your web browser. Click  on the page and then the web shows a dialog window for confirming. If you select “Yes” in the confirming dialog window, the storage is shutdown immediately. The Ready LED is also twinkling during the shutdown process, until power off.

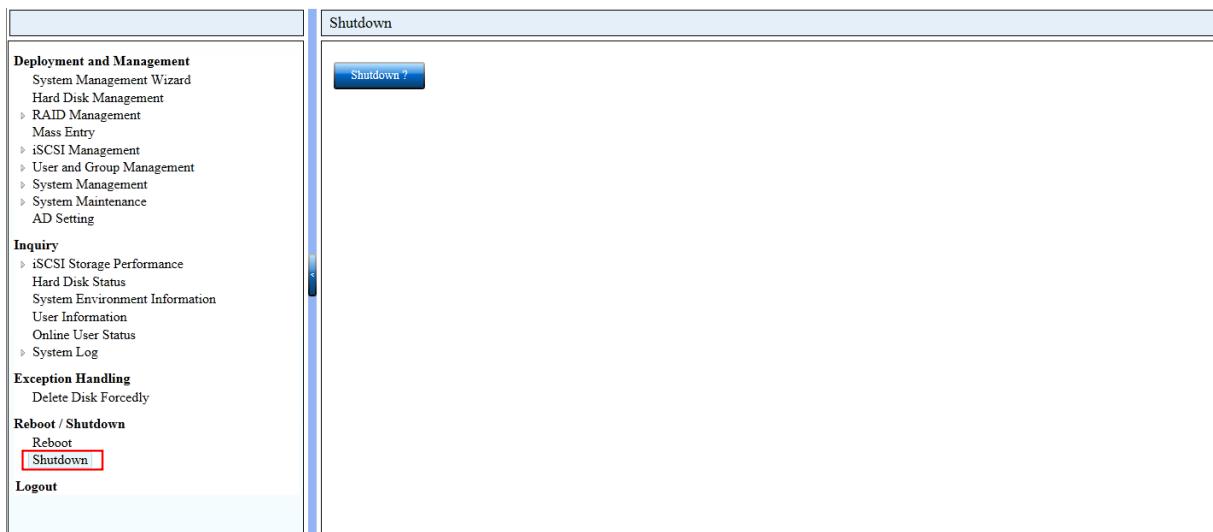

Fig. 2 Shut the storage down by Function List

1.2.3. Shutdown This Storage by Disk Status Panel of UI

The Disk Status of Web Management System includes a front panel of the storage, like Fig. 3. ① is shutdown button. You can click ① to execute shutdowning process. Your web browser shows a dialog for confirming. If you select “Yes” in the confirming dialog window, the storage is shutdowned immediately. The Ready LED is twinkling during the shutdowning process, until power off.

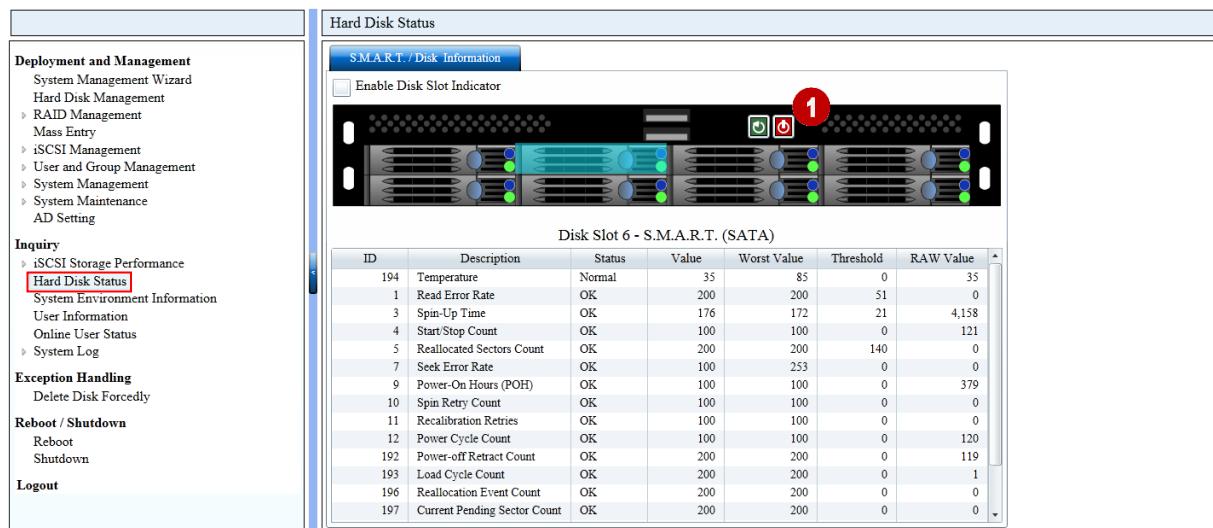

Fig. 3 Shut the storage down by Disk Status panel of UI

Fig. 3 Description:

① Power Switch at Disk Status panel

1.3. Reboot Storage

This storage provides two manners of rebooting the storage

1. Mouse clicks “Reboot” in the left field of management UI.
2. Mouse clicks ② in the Disk Status page of management UI.

The following describes the two manners.

1.3.1. Reboot This Storage by Function List of UI

The storage provides rebooting storage by Web Management System. Administrator can reboot the storage through Internet. Please look for “Reboot” in the left field of Web Management System, as shown in Fig. 4. In addition, click “Reboot” to show Reboot page in right field on your web browser. Click **Reboot ?** in the page and then the web shows a dialog window for confirming. If you select “Yes” in the confirming dialog window, the storage is rebooting immediately. The Ready LED is twinkling during the rebooting process, until the storage is “Ready” again.

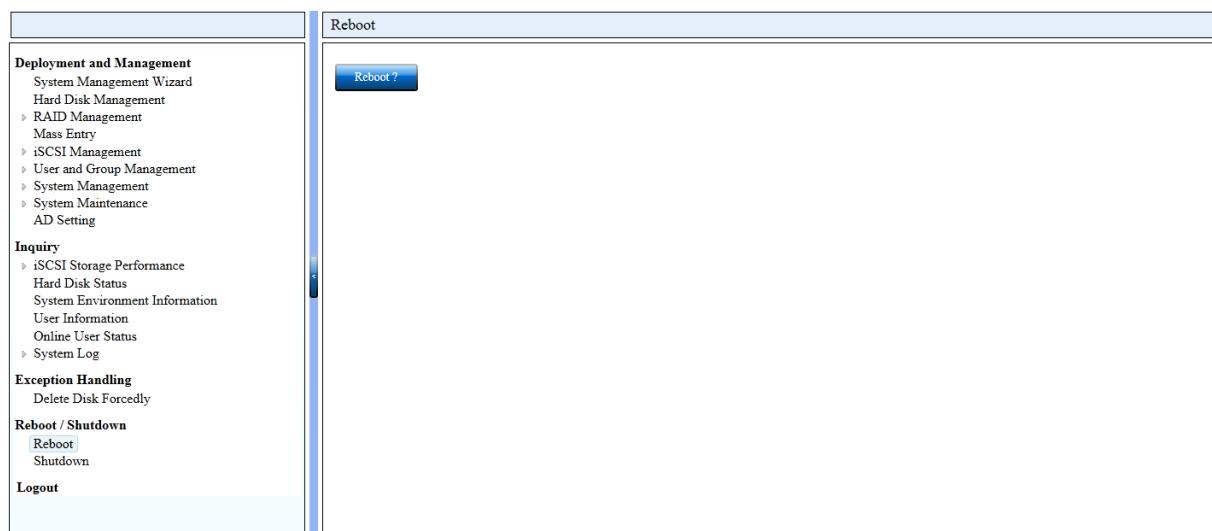

Fig. 4 Reboot the storage by Function List

1.3.2. Reboot Storage by Disk Status panel of UI

The Disk Status of Web Management System includes a front panel of the storage, like Fig. 5. ① is Reboot button. You can click ② to execute rebooting process. Your web browser shows a dialog for confirming. If you select “Yes” in the confirming dialog window, the storage runs shutdown processes and reboots itself immediately. The Ready LED is twinkling during the rebooting process, until the storage is “Ready” again.

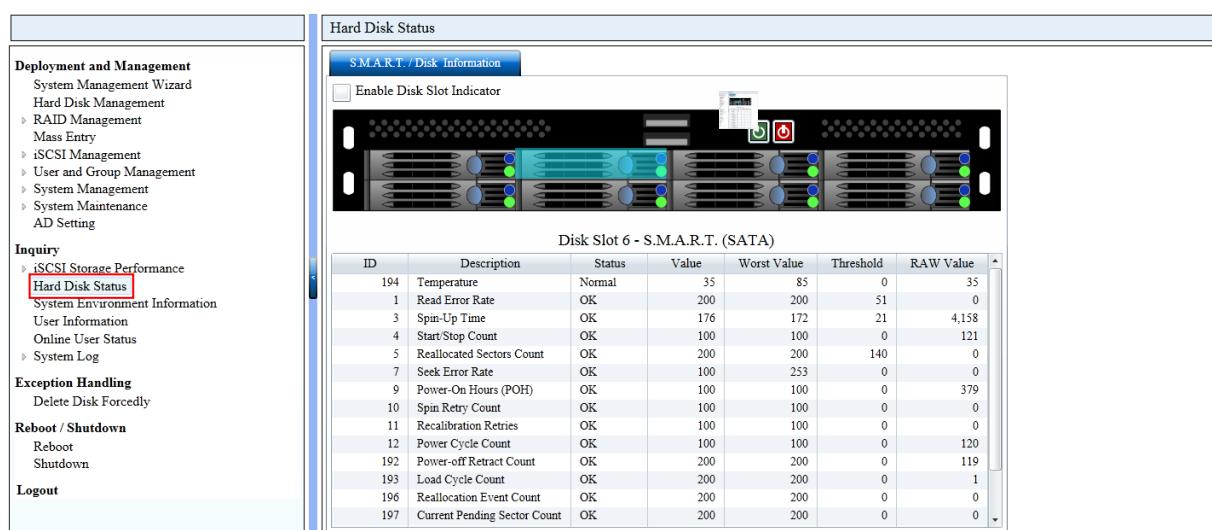

Fig. 5 Reboot the storage by Disk Status panel

Fig. 5 Description:

① Power Switch on Disk Status panel

2. Hardware Reset

Hardware Reset will reset all your configurations in the iSCSI Storage. Because this operation is dangerous, Hardware Reset button is hidden into the left hole of the front panel, like **Fig. 6 ①**. You can use a needle or a pen to **pull the button for 5 seconds**. Then, the ready light is twinkling and the storage shutdowns. In next boot, the storage is reset, like a new one.

Fig. 6 Hardware Reset Button

Fig. 6 Description:

- ① Hardware Reset button is hidden in the hole.

Hardware Reset function do following processes.

- ① Reset Administrator's password into 000000000000 (twelve 0).
- ② Clear RAID configuration
- ③ Clear iSCSI LUN configuration
- ④ Clear iSCSI Target configuration
- ⑤ Clear User information
- ⑥ Reset IP setting into default (default IP setting is 192.168.1.88/255.255.255.0)
- ⑦ Reset Maximum connections
- ⑧ Reset Alarm configuration
- ⑨ Reset System Setting configuration

After Hardware Reset, all configurations in this iSCSI storage disappear; Nevertheless, RAID configuration, iSCSI LUN configuration, iSCSI Target configuration and User information are still in your HDDs. Via these configurations, you can recover before configurations back to the storage, which has been hardware reset. Please do following steps after Hardware Reset.

- (1) Power-on your storage
- (2) Connect to your storage by IE (<https://192.168.1.88>)
- (3) Choose "System Migration"
- (4) Do System Migration. Please reference Section 4.8.3
- (5) Reboot
- (6) Connect to your storage by IE (<https://192.168.1.88>), again
- (7) Do "System Management Wizard"
- (8) Done

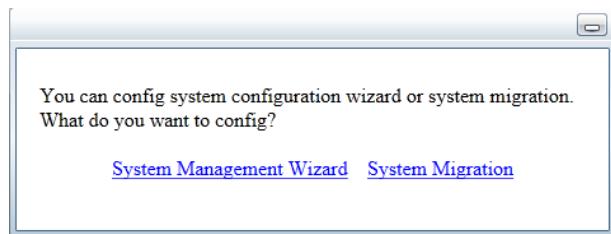

Fig. 7 Dialog of asking migration

3. Storage Initialization

When it is the first time to power on an iSCSI Storage, please do the following processes to initialize the iSCSI Storage.

1. Power on the iSCSI Storage and wait blinking Ready LED becomes sustained lighting. The blinking Ready LED means that the iSCSI storage is booting and has not readied to serve clients. If there are some HDDs in the iSCSI Storage, the status LED (Red) of HDD tray is lighting because these HDDs are not “Read”. Please reference 4.2.1 Reset HDD.
2. Before you connect to iSCSI Management System through a Web browser, please the first network port must configure a RJ45 cord. The first network port has the default IP address: 192.168.1.88. Your computer, which is going to connect to the web management system, has to be in a LAN segment, as same as 192.168.1.xxx. Please check out your computer’s network configuration.
3. Execute your web browser, such as Internet Explorer, like Fig. 8. You have to type “<https://192.168.1.88>” in URL field. For information security, “https” uses SSL to encrypt all communication data between your web browser and the storage.

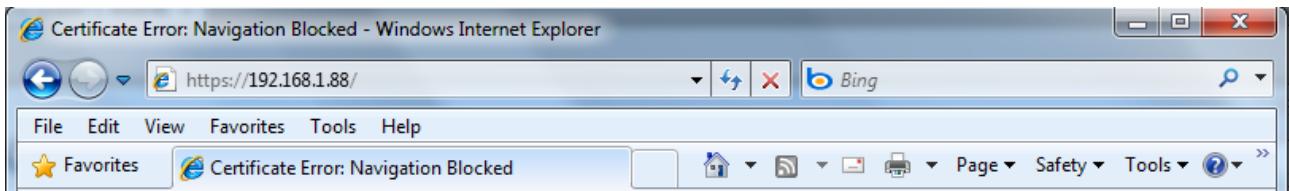

Fig. 8 Connect to the iSCSI Storage Management System by the default URL (<https://192.168.1.88>)

4. Then, your browser shows the mistrusted certification from the storage website, as shown in Fig. 9. Please choose and click [Continue to this website \(not recommended\)](#). Although the certification is mistrusted, the communication data between your web browser and the storage is still encrypted by SSL.

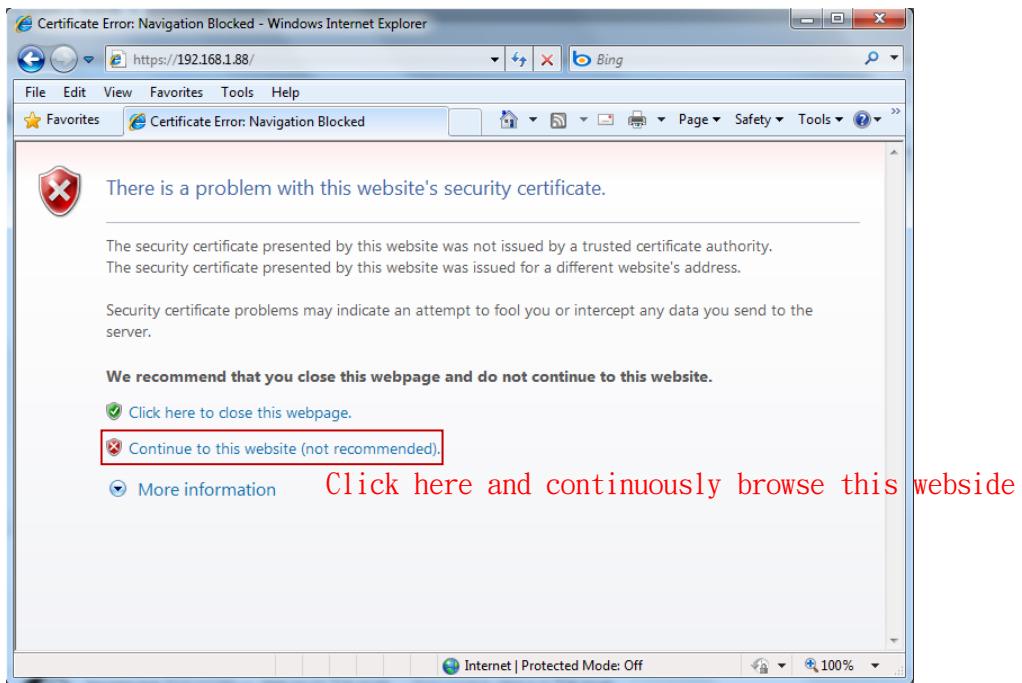

Fig. 9 Warning of CA

5. Fig. 10 is Login page of iSCSI Management System. Because the storage has not been initialized yet, please choose “iSCSI Storage Login”. Then, please enter username and password. The default username and password are **Admin** and **000000000000** (twelve 0). If “English” is not your mother language, you can choose other languages in ⑤ of Fig. 10. Finally, left click **Login** by your mouse and login to iSCSI Management System. Additionally, you can download IP SAN Connector from the storage. About the configurations and operations of IP SAN connector, please reference 8 IP SAN Connector.

Fig. 10 Login iSCSI Management System by default Account and Password

Fig. 10 Description:

- ① Although CA is not published by a mistrustful CA publishing company, SSL protects all communication information.
- ② Select a management function for this login. If you choose “Easy IP SAN Login” and login it, you will enter Easy IP SAN Management System, else you enter iSCSI Storage Management System. Because the iSCSI Storage has not been initialized yet, you have to choose “iSCSI Storage Login”.
- ③ Please type “admin”, which is the default managing account.
- ④ Please type “000000000000” (twelve 0), which is the default password for “admin”.
- ⑤ Choose language.
- ⑥ This is the URL for downloading IP SAN Connector, which is a very convenient tool for connecting to iSCSI storages.

6. This is the first time to enter iSCSI Management System. The system automatically executes “System Management Wizard” in the right field of web page, as shown in ① of Fig. 11, to guide you to initialize the iSCSI Storage. In the first stage, the system asks you change the password of “Admin” because of the security issue. You must enter the old password in ② and enter new password two times in ③ and ④. The new password must include letters and digits and the length of new password has to be over 12 words, ruled by iSCSI Standard (RFC 3720). Finally, click **Next** to do next stage.

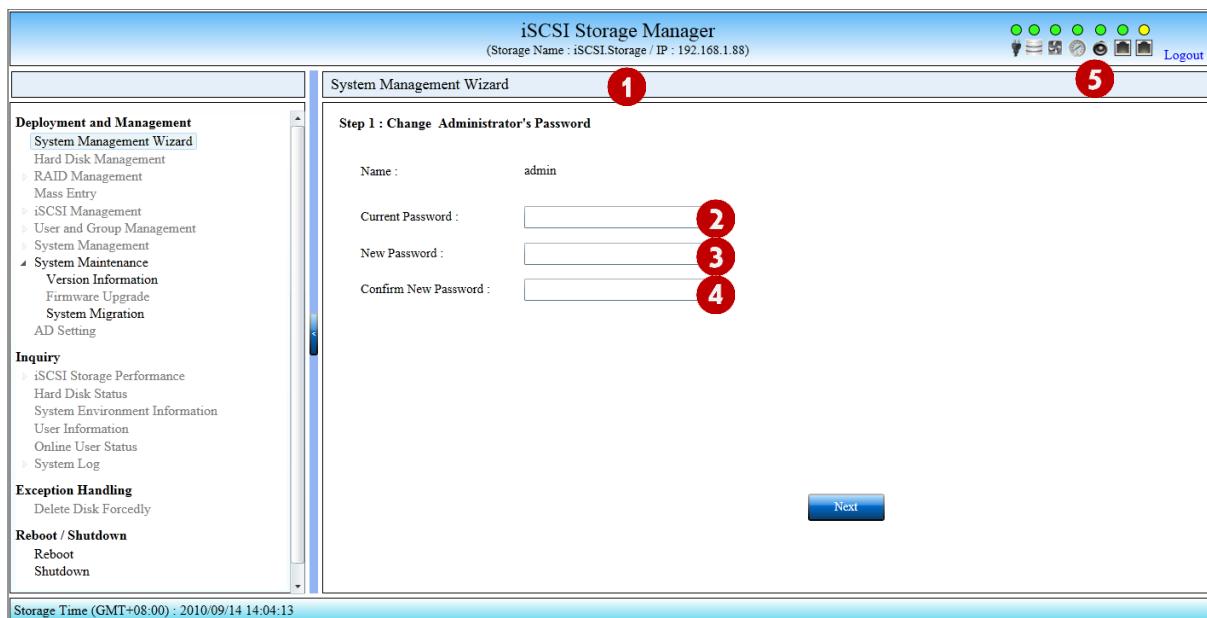

Fig. 11 Change password of “admin”

Fig. 11 Description:

- ① The right field automatically executes “System Management Wizard”, which guides you to initialize this iSCSI Storage.
- ② You have to type the default password (“000000000000”, twelve 0) of “admin” here because the iSCSI storage has not been initialized yet.
- ③ Type your new password here.
- ④ Type your new password again.
- ⑤ These are Network port statuses. The system illustrates network port conditions via different colors of circle lights.

Green Light - A network port has an IP address and connects to a network device (such as Hub, Switch and Router) or a network host (such as a PC or a Server).

Yellow Light - A network port must be without any IP address.

Red Light - A network port must have an IP address but it must not connect to any network device or any network host.

7. Name this iSCSI Storage and describe it. That information will help your management in the future, like Fig. 12. Then, you have to decide the maximum concurrent iSCSI connections of this iSCSI Storage. If the value is larger, there are many users to share resources of the storage, such as storage capacity and network bandwidth, and then the quality of server will be lower. Hence, please decide an appropriate value, which depends on your application. Finally, click **Next** to do next stage.

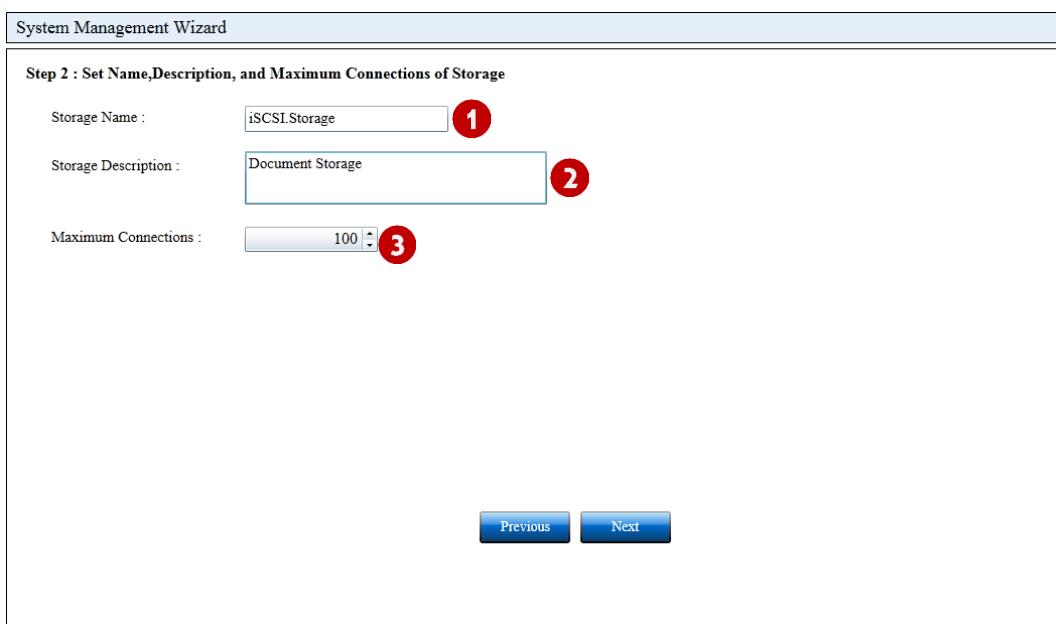

Fig. 12 Rename this iSCSI Storage, describe this iSCSI Storage and determine the maximum concurrent iSCSI connections

Fig. 12 Description:

- ① Naming this iSCSI Storage uses an understandable string.
- ② Describing this iSCSI Storage uses a string, which describes this storage's functions and purposes.
- ③ Setting the maximum number of iSCSI connections in which this iSCSI storage can concurrently serve them.

8. Configure the permitted LAN segment of iSCSI Management System. The iSCSI Management System can limit the LAN segment of a PC, which can connect to the iSCSI Management System. There are two kinds of account in the iSCSI Storage. You can set their permitted segment independently.

Administrator:

- ① of Fig. 13 set the permitted LAN segment of administrator accounts. You have two rules, as following:

LAN Only:

An administrator account manages the storage by the PC in the LAN segment, which is the LAN segment of the iSCSI Storage, too. That means that a PC in Internet cannot manage the storage. For example, if network settings of a storage are IP Address = 61.212.1.15, Network Mask = 255.255.255.0 and the Gateway = 61.212.1.1. Thus, the administrator must use a PC, which uses IP address = 61.212.1.xxx, where the xxx is the range from 2~254, excepting 15.

WAN:

An administrator can use any PC to connect to iSCSI Management System.

① of Fig. 13 set the permitted LAN segment of normal accounts. You have two rules, as following:

LAN Only:

A normal account manages his/her account by the PC in the LAN segment, which is the LAN segment of the iSCSI Storage, too. That means that a PC in Internet cannot manage the storage. For example, if network settings of a storage are IP Address = 61.212.1.15, Network Mask = 255.255.255.0 and the Gateway = 61.212.1.1. Thus, the account must use a PC, which uses IP address = 61.212.1.xxx, where the xxx is the range from 2~254, excepting 15.

WAN:

A normal account can use any PC to connect to iSCSI Management System.

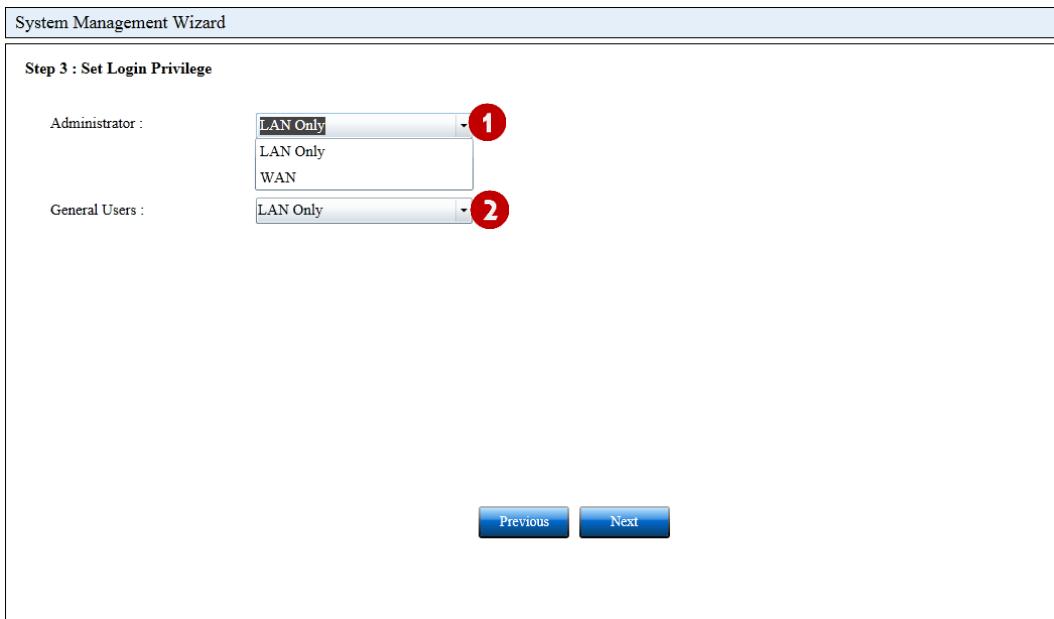

Fig. 13 Configure where admin and users can login this management system from.

9. This stage configures the network setting of iSCSI storage, as shown in Fig. 14. This page illustrates how many network ports this iSCSI storage has. Field ① shows the current setting of network ports. The field under ① provides port settings interfaces in Tabs and a DNS setting interface. For different applications, you should follow the rules as followings:

iSCSI Storage directly serves clients:

If the storage serves many clients through network switches, please configure IP addresses of the network ports in a same network segment and then these ports will share loading each other. For example, if the storage is located in the segment:61.212.1.xxx, please find out 6 no-collided IP addresses and configure them in the 6 network ports respectively.

iSCSI Storage directly serves servers or workstations:

If the storage serves servers without any network switch, please configure the 6 network ports in 6 independent network segments. For example, if an IP address of a server is 192.168.1.2, the storage's network port, connecting to the server, should be 192.168.1.xxx, except 192.168.1.2. In addition, an IP address of another server is 192.168.2.2, the storage's network port should be 192.168.2.xxx, except 192.168.2.2.

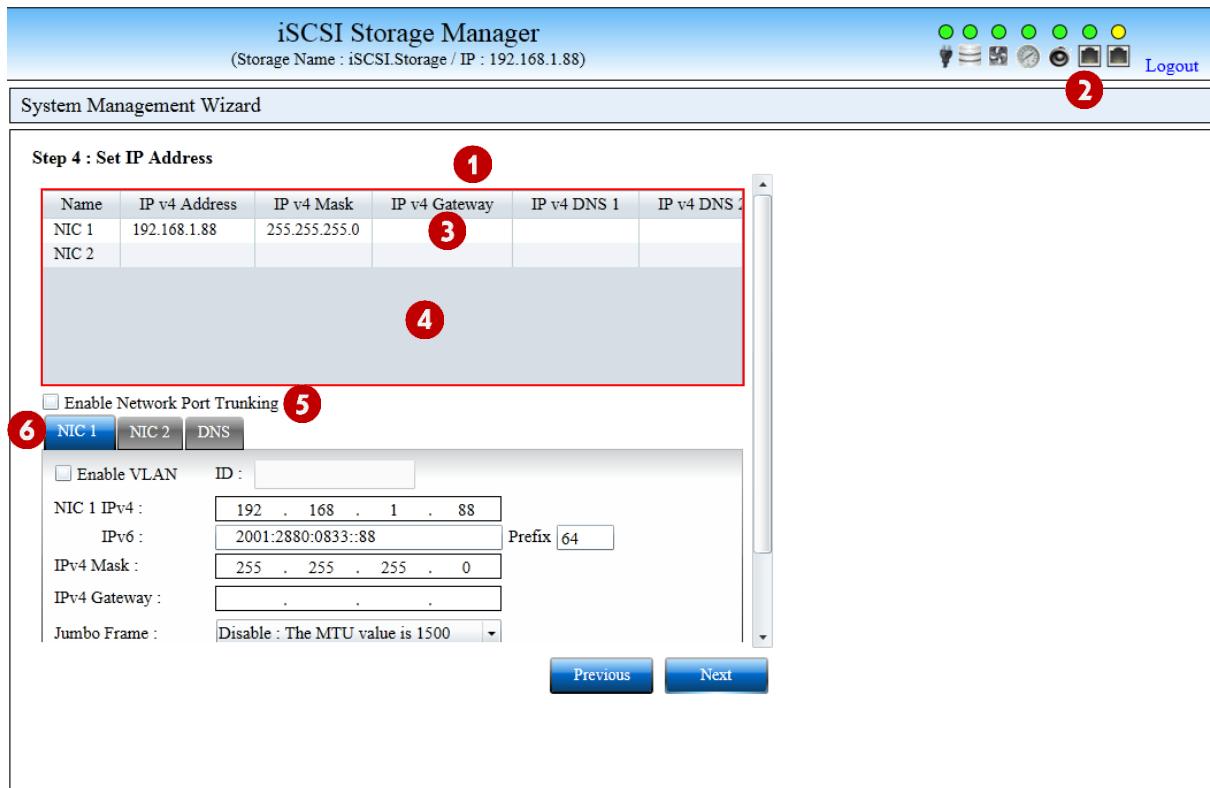

Fig. 14 Configure IP Address

Fig. 14 Description:

- ① This field illustrates the overview of network setting.
- ② These are Network port statuses. The system illustrates network port conditions via different colors of circle lights.

Green Light - A network port has an IP address and connects to a network device (such as Hub, Switch and Router) or a network host (such as a PC or a Server).

Yellow Light - A network port must been without any IP address.

Red Light - A network port must have an IP address but it must not connect to any network device or any network host.

- ③ The first network port has an IP address. Because this iSCSI Storage has not been initialized yet, the first network was the default IP address – 192.168.1.88.
- ④ IP address fields of NIC 2, NIC 3, NIC 4, NIC 5 and NIC 6 are empty. These network ports have not been set any IP address yet.
- ⑤ Enable Network Trunk function
- ⑥ Choose a NIC, which you are going to configure.

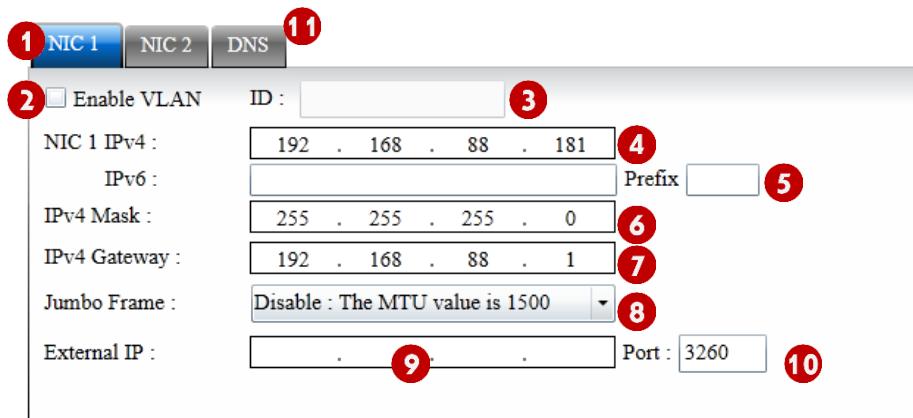

Fig. 15 Configure a NIC's IP address

Fig. 15 Description:

- ① Choose a NIC, which you are going to configure.
- ② Enable VLAN
- ③ Setup VLAN ID for this NIC
- ④ Editable Field for inputting IPv4 Address
- ⑤ Editable Field for inputting IPv6 Address
- ⑥ Editable Field for inputting IPv4 Network Mask
- ⑦ Editable Field for inputting IPv4 Gateway when this iSCSI storage is accessible from Internet hosts.
- ⑧ Configure the frame size of MAC protocol (CSMA/CD). Before you determine the size, you must check out the maximum frame size of your Ethernet switches.
- ⑨ External IP address of your NAT server or DHCP server must be configured when this iSCSI Storage is accessible from Internet hosts and uses a private IP address.
- ⑩ The mapping port from your NAT server or DHCP server
- ⑪ Enter DNS setting page

VLAN Setting

This iSCSI Storage provides VLAN in all of network ports. You choose a network port and click the Tab. you can find out the check box (② of Fig. 15) to enable VLAN function. Then give the network port a VLAN ID. Please fully understand VLAN standard before configuring them. For example, two VLAN ports have different VLAN ID respectively. The IP addresses of the two ports must belong to two different LAN segments respectively.

Setting of iSCSI Storage behind firewall or NAT

An IP address mapping from a private IP to a public IP should be set if your storage behind a firewall or a NAT server has to serve users from Internet. When an iSCSI Storage is located behind firewall or NAT and uses private IP addresses, such as 192.168.xxx.xxx, you must set the external IPs and the external Ports in network ports. In your Firewall or NAT, you must create a record for mapping from the private IP of the storage to the public IP of the Firewall and NAT. For example, a NAT server obtains a public IP: 61.220.70.175. The NAT should create a mapping, such as 61.220.70.175:3260 -> 192.168.1.88:3260, where 192.168.1.88 is the IP address of the storage and 3260 is the port of the storage. Then, in IP configuration of the storage, the network port with 192.168.1.88 should be set that external IP address and the external port, where are 61.220.70.175 and 3260 respectively. About the detail information of these setting, please reference the manual of a Firewall server or NAT server.

At the last of tab list, as shown in Fig. 16, DNS page provides you for configuring two Domain Name Servers in this iSCSI storage.

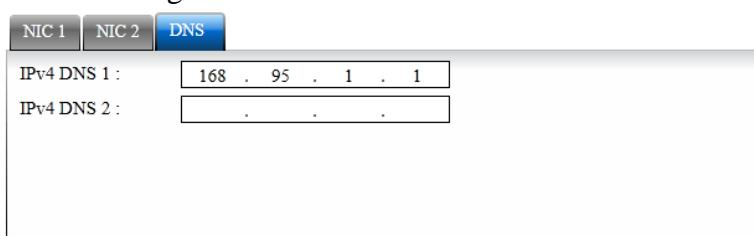

Fig. 16 Configure DNS

The storage merges network ports into one port, called Bond1, when you trunk all bandwidth of the separated network ports. For example, there are 6 network ports in Fig. 16. After enabling the trunk function in ① of Fig. 17, the storage merges the 6 network ports into one Bond1, as shown in ② of Fig. 17.

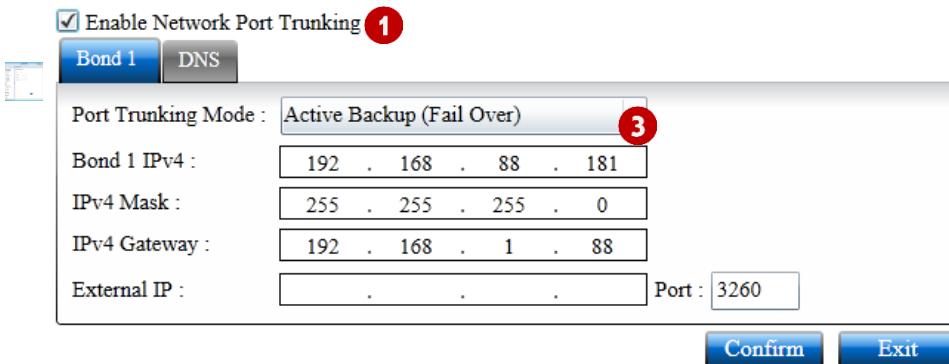

Fig. 17 Configure network trunk function at System Management Wizard

Fig. 17 Description:

- ① Enable Network Port Trunking function.
- ② NIC1~NIC6 are disappeared. The 6 network ports are trunked into "Bond 1".
- ③ Select Trunking Mode.

Then, please choose the trunking mode at Fig. 18.

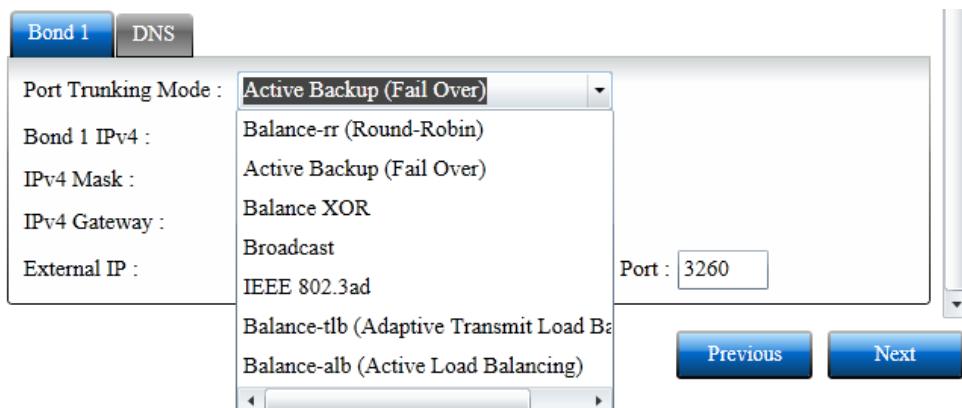

Fig. 18 Configure Network Trunk Mode at System Management Wizard

Network Trunk Mode Description:

- (1) Active Backup (Fail Over)
Network ports fail-over each other, but the total bandwidth does not increase.
- (2) Balance-RR (Round-Robin)
The transmitting data are shared among network ports so the total bandwidth increases. When a network port fails, other network ports take the load of the failing network port. This mode supports fail-over and load-balance simultaneously.
- (3) Balance XOR
This mode also supports fail-over and load-balance simultaneously, but the load-balance algorithm is differently from Balance-RR mode.
- (4) Broadcast
All network ports send same packets and receive same packets in the same time. The network ports fail-over each other, but the total bandwidth does not increase.
- (5) IEEE 802.3ad
Group network ports. One of the networks ports is working and other network ports are backup ports. When the working network port fails, one of the backup ports replace the fault network port. If you want to do this mode, please make sure that all NICs and the switch support 802.3ad protocol.

- (6) Balance-tlb(Adaptive Transmit Load Balancing)
One of the network ports receives data and all of the network ports can send data.
- (7) Balance-ale(Active Load Balancing)
All of the network ports can send and receive data.

10. Configure Time Zone, Date and Time of the storage. It is important to keep correct time of the storage since the system log of the storage references the time. If the time is incorrect, it is hard to look for problems by the system log. You can check the system time of the storage in ① of Fig. 19. If it is incorrect, please correct it.

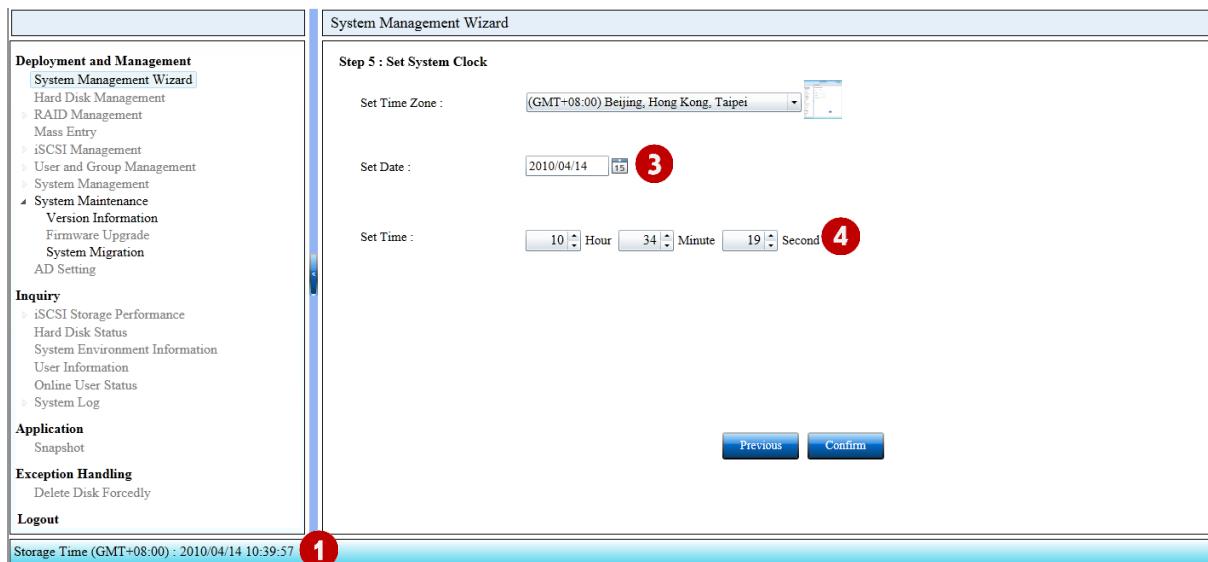

Fig. 19 Configure Time Zone, Date and Time of iSCSI Storage

Fig. 19 Description:

- ① The time of this iSCSI Storage
- ② Select Time Zone.
- ③ Configure Date.
- ④ Configure Time.

11. Finish System Management Wizard. When you see Fig. 20, the System Management Wizard is finish and the system is rebooting. Please wait until that the ready LED is sustained light.

Fig. 20 System Management Wizard is finished and reboot this iSCSI Storage

12. After rebooting of the storage, please input the new IP address on your web browser and then use new password to login the management system, as shown as Fig. 21.

Fig. 21 After initializing the iSCSI Storage, “admin” login by new password

4. iSCSI Management System

This iSCSI storage uses a web interface GUI system to manage the iSCSI storage. For security issues, you must login the management system by entering a username and a password. To prevent trying the username and the password, the storage just allows you try 4 times to login to Storage Management System. If the management system rejects your username and password 4 times by the storage, the storage will lock your username for 10 minutes, such as Fig. 23. During the locking, you cannot login to Storage Management System even through you use correct username and password.

Fig. 22 Username or Password Error

Fig. 23 Admin is locked

Signo iSCSI Storage uses web browsers to manage it. Administrator connects to the iSCSI Storage management system through a web browser and the IP address, configured at Section 3. Fig. 24 is the page layout of the management system. The top bar includes our logo, the IP address, which you connected to and system statuses ①. The system statuses help administrator to understand system situations. Please look for the description of system statuses in 5.3 System Environment Information. ② shows the model name of the iSCSI Storage. ③ denotes which management function is in the field under ③.

The main page is divided into a left field and a right field. The left field list the management functions of the iSCSI Storage and the right field is operating field of a management function. The iSCSI storage provides following management functions:

1. Deployment and Management
 - (1) . System Management Wizard
 - (2) . Hard Disk Management
 - (3) . RAID Management
 - (4) . Mass Entry
 - (5) . iSCSI Management
 - (6) . User and Group Management
 - (7) . System Management
 - (8) . System Maintenance
 - (9) . AD Setting
2. Inquiry
 - (1) . iSCSI Storage Performance
 - (2) . Hard Disk Status
 - (3) . System Environment Information
 - (4) . User Information
 - (5) . Online User Status
 - (6) . System Log
3. Exception Handling
 - (1) . Delete Disk Forcely
4. Reboot/Shutdown
 - (1). Reboot
 - (2). Shutdown
5. Logout

Finally, the bottom bar ⑥ shows the time in the iSCSI storage. It is important to keep the time correct. The log system of iSCSI storage in the iSCSI storage records all events included when they happen. If the time is incorrect, these events are recorded wrong time by the log system.

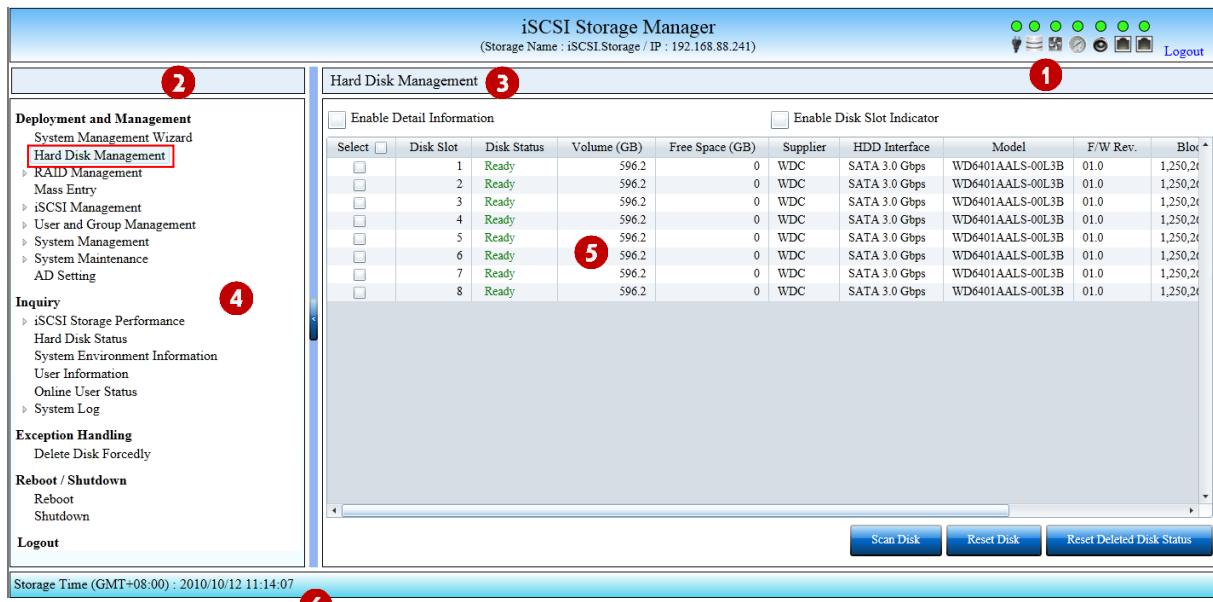

Fig. 24 Introduction of iSCSI Storage Manager Page

Fig. 24 Description:

- ① System status quick view obviously illustrates the conditions, which are distributed in Hard Disk Management, RAID Management and System Management. The administrator can quickly understand system conditions and remove them. The more detail description is at 5.3 System Environment Information.
- ② The model name of this iSCSI Storage
- ③ The current page name
- ④ Management Function List
- ⑤ Management Function page
- ⑥ The time of iSCSI storage, administrator must always keep it correct.

4.1. System Configuration Wizard

System Management Wizard guides administrator to initiate an iSCSI Storage. Section 2 has described the iSCSI Storage initiated process. If you want to initiate this iSCSI storage by the wizard again, you can click “System Management Wizard” to trigger the initiated process again.

4.2. Hard Disk Management

After the next successful login, the first page is Hard Disk Management, like Fig. 25. For example, this iSCSI storage has 8 slots. Hard Disk Management lists 8 slots on the webpage.

HDDs, used for the iSCSI storage, have to be ready before they participate in RAID volumes. When administrator plugs in a HDD into running iSCSI storage, the storage smartly recognizes the condition of the HDD. There are three possible statuses when you plug a HDD into a slot.

1. *Ready* - When you plug a new HDD into a slot, the status has to be “Ready”.
2. *Configured* - If the plugged HDD has worked in an iSCSI Storage, the status has to be “Configured”.
3. *Rescuable* - If the plugged HDD is able to rescue a crashed RAID volume in the iSCSI storage, the status has to be “Rescuable”.

Fig. 25 Disk Initialization

Fig. 25 Description:

- ① Enable Display Detail Information for HDD
- ② Enable HDD Location Indicator. When administrator clicks a HDD on this page, the Red LED on the HDD's tray is twinkling for 20 seconds.
- ③ Select all of HDD
- ④ Select a HDD
- ⑤ These HDDs can participate to any RAID volume when the status is “Ready”.
- ⑥ The HDDs are able to rescue some RAID volumes in this iSCSI storage.
- ⑦ The HDD had been used in other iSCSI storages.
- ⑧ The slot did not connect to any HDD.
- ⑨ Rescan SAS/SATA slot to refine HDDs.
- ⑩ Reset “Configured” status and “Rescuable” status to “Ready” status.
- ⑪ Remove Deleted Disks, which are forcedly deleted by admin.

Column descriptions of Disk information list:

① Select

Each of SAS/SATA slot includes Select field. You have to select some target HDDs first and then do some operations, such as reset status or reset “Deleted Disk Status”.

② Disk Slot

This iSCSI Storage includes 8 SAS/SATA2 Hot-swapable slots. Hard Disk Management assigns a unique number to each slot. Fig. 26 illustrates the mapping from slot numbers to positions on the storage chassis.

Fig. 26 SAS/SATA port sequence of iSCSI storage

③ Status

This column denotes the HDD status. HDD status has some values, as shown in following Table 1.

Status	Description
Empty	This slot does not connect to any HDD.
Ready	This slot connects to a HDD and the HDD has been “ ready ” to use in RAID system of the iSCSI Storage.

Configured	This slot connects to a HDD and the HDD had been used in other iSCSI storages before.
Rescuable	The HDD had been used in this iSCSI storage and is able to rescue a RAID volume in this moment.
Crash	This slot connects to a HDD but this HDD cannot be Read/Written.
Deleted Disk	This slot is closed. You can remove the HDD from the slot to reopen the slot or click  to reset the slot.

Table 1 HDD status

④ Volume:

Show available capacity of the HDD in units of Giga-Byte (GB).

⑤ Free Space

Show free capacity of the HDD in units of GB. The free capacity can be used for a RAID volume.

⑥ Supplier

Illustrate the manufacturer of the HDD.

⑦ HDD Interface

Show the interface spec. of the HDD

 **Model**

Show the model name of the HDD.

⑨ F/W Rev.

Illustrate the firmware version of the HDD.

⑩ Blocks

Show how many blocks in the HDD.

⑪ Block Size

Show Block size of the HDD. The block size is usually 512 Byte (0.5KB).

⑫ Disk ID

Disk ID, assigned by the iSCSI Storage, is a unique number of an initialized HDD. If an initialized HDD is deleted, the HDD's Disk ID is going to be deleted and will not be used again. For example, an iSCSI Storage is plugged 16 HDDs. After initializing these HDDs, the storage offers Disk ID = 1 ~ 8 to these 8 HDDs. Administrator deletes a HDD, which has Disk ID=8. Then, Administrator initializes the HDD again. The storage offers Disk ID=17 to the HDD.

4.2.1. Reset HDD

When statuses of HDDs are “Configured” or “Rescuable”, these HDDs cannot join to any RAID volume.  can reset such two statuses into “Ready”. Please follow these following steps to reset HDDs.

1. Select some “Configured” HDDs or “Rescuable” HDDs

2. Click 

If resetting selected HDDs is successful, the status fields of the selected HDDs become “Ready”, as shown in Fig. 27.

Warning - After reset HDDs, these HDDs loss all DATA and RAID configurations.

Fig. 27 HDDs have reset

Fig. 27 Description:

- ① These slots connect to HDDs and the HDDs are reset. Therefore, these statuses are “Ready”.
- ② These slots have not connected to any HDD yet.

4.2.2. Clean Force Deleted Status of HDDs

An unnormal HDD is forcedly deleted by Administrator or the RAID system when the HDD has some unrecoverable errors and interferes or stops the RAID system. For recovering the service of RAID system, Administrator should visit “Delete Disk Forcely” page to delete the slot of the HDD and set the status of the slot into “Deleted Disk”. There are two ways to release “Deleted Disk” status from the slot.

- (1) Replace the unnormal HDD with a normal HDD. when Administrator has removed the unnormal HDD from the slot, the status of the slot is still “Deleted Disk”. Administrator has to plug a normal HDD into the slot to release ” Deleted Disk” status. Finally, the status of the slot is ”Non-Initial”.
- (2) Using **Reset Deleted Disk Status** in “Hard Disk Management” page and “Delete Disk Forcely” reset “Deleted Disk” status from a slot. Please visit those two pages and select slots with “Deleted Disk” status. Then click **Reset Deleted Disk Status** to reset the selected slots. Finally, the status of the slot is ”Non-Initial”.

In Fig. 28, Slot 16 had been forcedly deleted so the status of Slot 16 is ”Deleted Disk”. Administrator should select it and click **Reset Deleted Disk Status** to reset Slot 16.

Fig. 29 Detail Information of a Disk

Fig. 29 Description:

- ① Enable showing some detail information of a HDD.
- ② After clicking a row of a HDD, the background color of the row is changed from white to

orange. A new sub-table is inserted under the row and displays some RAID volumes, which use the HDD.

③ The table under the clicked row shows some RAID volumes, which use the HDD in the row.

4.3. RAID System

The RAID system of the iSCSI Storage gathers HDDs configured in this storage to create some kinds of RAID volumes for some purposes. RAID levels offered by this storage are described in following Table 2.

RAID Level	Description	Capacity	Remark
RAID 0	<p>Purpose : Gather some HDDs to be a big and fast RAID volume. Storing data to a RAID 0 volume, the data is parallel stored by the participant HDDs. Reading data from the RAID 0 Volume, the data is parallel read from these HDDs. Therefore, the IO performance of RAID 0 is better than that of other RAID level.</p> <p>Amount of HDDs : Minimum – 2 HDDs Maximum – 8 HDDs</p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Better capacity efficiency 2. High IO Speed <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. No data protected ability. A RAID 0 volume has broken because one of the participant HDDs has broken. All of data in the RAID 0 volume is lost. 	$S = D \times N$ <p>S : Capacity of RAID 0 volume D : The capacity, offered by each participant HDD. N : amount of participant HDD</p>	RAID 0 volume is good for some applications, which need high throughput, but the data is not important.
RAID 1	<p>Purpose : Using 2 HDDs creates RAID 1 volume for protecting data. Data is stored in one of the two HDDs and a copy of the data is stored in another one HDD simultaneously.</p> <p>Amount of HDDs : 2 HDDs</p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Protect Data <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. Pool Performance. 	$S = D$ <p>S : Capacity of RAID 1 volume D : The capacity, offered by each participant HDD.</p>	RAID 1 volume is popular in small storages. Big storages usually employ RAID 5 volumes for protecting data.

RAID 10⁺	<p>Purpose :</p> <p>Combining some RAID 1 volume into a RAID 0 volume can improve performance of RAID volume. Usually, RAID 10 combines two RAID 1 volumes into a RAID 0 volume, including 4 HDDs. RAID technology can combine many RAID 0 volumes into a RAID 0 volume. The kind of RAID 10 is called RAID 10⁺.</p> <p>Amount of HDDs :</p> <p>Minimum – 4 HDDs Maximum – Even Amount of HDD</p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Protect Data 2. Improve performance of RAID 1 3. Save CPU power <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. The performance of RAID 10⁺ is half of RAID 0. 	$S = D \times N \div 2$ <p>S : Capacity of RAID 10⁺ volume D : The capacity, offered by each participant HDD. N : amount of participant HDD</p>	RAID 10 ⁺ can protect data in crashing of one participant HDD. If two participant HDDs crashed, the two HDD must be in two different RAID 1 volumes respectively.
RAID 5	<p>Purpose :</p> <p>RAID 5 volumes protect data and provide high IO throughput. There is no data loss when one participant HDD crashes.</p> <p>Amount of HDDs :</p> <p>Minimum – 3 HDDs Maximum – 8 HDDs</p> <p>Advice:</p> <p><i>Building a RAID 5 volume on 8 HDDs has better performance. For example, an iSCSI Storage has 16 HDDs. The performance of building one RAID 5 volume on 1~8 HDDs and another RAID 5 volume on 9~16 HDDs is better than that of building a RAID 5 volume on 1~16 HDDs.</i></p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Protect Data 2. Good Performance <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. Need more CPU power than RAID 1 and RAID 10⁺. 2. Need more memory 	$S = D \times (N - 1)$ <p>S : Capacity of RAID 5 volume D : The capacity, offered by each participant HDD. N : amount of participant HDD</p>	

RAID 6	<p>Purpose : RAID 6 volumes protect data and provide high IO throughput. There is no data loss when two participant HDDs crash.</p> <p>Amount of HDDs : Minimum – 4 HDDs Maximum – 8 HDDs</p> <p>Advice: <i>Building a RAID 6 volume on 8 HDDs has better performance. For example, an iSCSI Storage has 16 HDDs. The performance of building one RAID 6 volume on 1~8 HDDs and another RAID 6 volume on 9~16 HDDs is better than that of building a RAID 6 volume on 1~16 HDDs.</i></p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Protect Data when two HDDs crashes <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. Need more CPU power than RAID 5, RAID 1 and RAID 10⁺. 2. Need more memory 	$S = D \times (N - 2)$ <p>S : Capacity of RAID 6 volume D : The capacity, offered by each participant HDD. N : amount of participant HDD</p>	
JBOD	<p>Purpose : Combine free spaces of every HDD in to a huge RAID volume, but files are sequentially stored on the HDDs.</p> <p>Amount of HDDs : Minimum – 2 HDDs Maximum – 8 HDDs</p> <p>Advantage : Improve space efficient.</p> <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. No data protection. 2. Poor Performance 	$S = D_1 + D_2 + \dots + D_N$ <p>S : Capacity of JBOD volume D_x : the free spaces are offered by every participant HDDs. (Sizes of these free spaces may be different each other. N : amount of participant HDD</p>	
Single Disk	<p>Purpose : A HDD is a RAID volume.</p> <p>Amount of HDDs : A HDDs</p> <p>Advantage :</p> <ol style="list-style-type: none"> 1. Low computing power <p>Disadvantage :</p> <ol style="list-style-type: none"> 1. No data protection. 2. Poor Performance in a single user. 	$S = D$ <p>S : Capacity of single disk volume D : The capacity of the HDD</p>	

Table 2 Description of RAID levels provided by this iSCSI Storage

iSCSI service cannot directly use capacities of HDDs before building RAID volumes. New HDDs must be “Ready” state. The RAID system RAIDs these initialized HDDs into some RAID volumes. iSCSI service can build some iSCSI LUNs on the RAID volumes.

4.3.1. Create New RAID Volumes

Administrator can create RAID volume on “Ready” HDDs. Please open “RAID Management” in left function menu and select “Create/Delete”, like Fig. 30. Following the under steps creates a new RAID volume.

Step 1 – Execute RAID Creation Wizard

Click **Create RAID** in Fig. 30 ⑥. RAID Creation Wizard is operated, like Fig. 31.

Fig. 30 RAID Management Page

Fig. 30 Description:

- ① Enable showing some detail information of a RAID volume.
- ② Enable the function of disk indication light. This function helps administrator to find out some HDDs in a RAID volume. After enabling it, administrator clicks a row of RAID volume. Some error LEDs (Red Light) on HDD tray are going to glitter. These HDDs in glittering red LEDs are used in the clicked RAID.
- ③ List existed RAID volumes, including ordinary RAID volumes, initiating RAID volumes, degraded RAID volumes and crashed RAID volumes.
- ④ Rescan RAID volume information
- ⑤ Go to the page for creating iSCSI LUNs
- ⑥ Begin to create a RAID volume through RAID creating wizard. Such wizard guides administrator to create a RAID volume step by step.
- ⑦ Remove the selected RAID volumes.

Step 2 – Name the creating RAID volume

Please use an understandable and unique string to name this new RAID volume. Administrator needs the recognized name for management and assigning space to iSCSI LUNs in the future.

Step 3 – Choose RAID Level

This iSCSI Storage provides many RAID levels for varied purposes. Administrator must clearly understand the features of RAID levels according to Table 2. After decided RAID level of the new RAID volume, this wizard forces administrator to select enough amount of HDDs in Step 5.

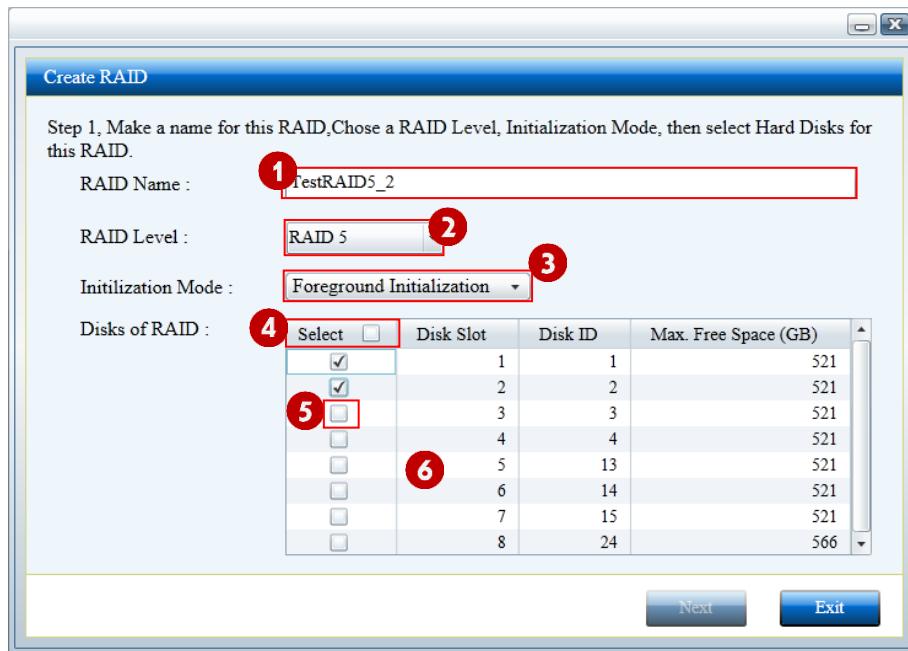

Fig. 31 Create RAID Wizard – RAID Name, RAID Level and Disks of RAID

Fig. 31 Description:

- ① Name the RAID volume by an understandable and unique string.
- ② Choose RAID Level, such as 0, 1, 10⁺, 5, 6, JBOD, Single Disk.
- ③ Decide how to initialize this RAID volume.
- ④ Select all of available HDD to participate the RAID volume. These HDDs must be initiated and have free space (free space >0).
- ⑤ Select a HDD to participate in the RAID volume.
- ⑥ Available HDD list

Step 4 – Choose Initialization Mode

If administrator selected one of RAID 1, 10⁺, 5, 6 in Step 3, the wizard asks administrator to decide how to initialize this RAID volume.

There are three initialization modes supported by this iSCSI Storage, as shown in follows:

1. Full Initialization

Full Initialization would scan and clean all sectors of HDD, participated in the RAID volume. When the storage is initializing the RAID volume, administrator cannot create iSCSI LUNs. After finishing the initialization, administrator would create iSCSI LUNs for targets.

Full Initialization can find out problems of HDDs before the RAID volume is used so it can avoid some risks of data protection. For data protection issues, we strongly suggest administrator do Full Initialization for creating a RAID volume.

2. Background Initialization

Background Initialization also scans and cleans all sectors of HDD, participated in the RAID volume. However, administrator can create iSCSI LUNs and use them during initializing the RAID volume. It is an eclectic solution between efficiency issues and data protection issues.

3. Non-initialization

Non-initialization does nothing in creating a RAID volume. When administrator finished RAID Creating Wizard, he can create iSCSI LUNs and use them immediately. However, non-initialization process does not scan all sectors of HDD. There are a few risks about data protections.

Step 5 – Select HDDs

According to the RAID level, decided in step 3, the wizard wait administrator selecting enough and correct amount of HDDs. If the amount of HDDs is insufficient and incorrect, **Next** becomes **Next** and administrator cannot do the next step. For example, in Fig. 32, administrator chooses RAID 5 (need 3 HDDs at least) but he/she just selects 2 HDDs. So **Next** is disabled. In Fig. 33, administrator selects over 2 HDDs for the RAID 5 volume so **Next** is enabled.

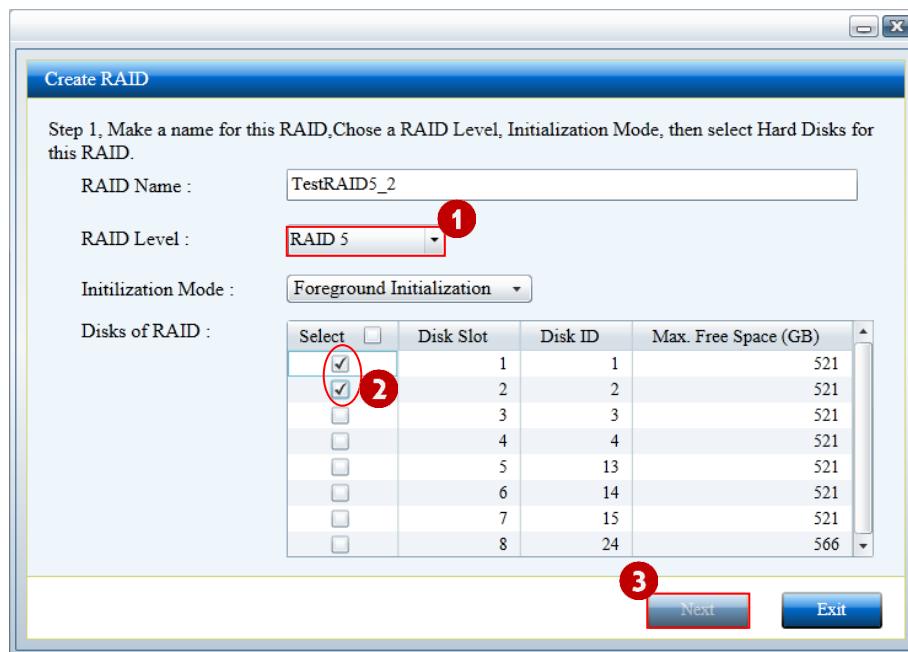

Fig. 32 Amount of HDD is not enough to create a RAID 5 volume

Fig. 32 Description:

- ① Choose RAID 5 level, which needs 3 HDDs at least.
- ② 2 HDDs are selected.
- ③ The new RAID 5 volume cannot be created on the two HDDs so **Next** is disabled.

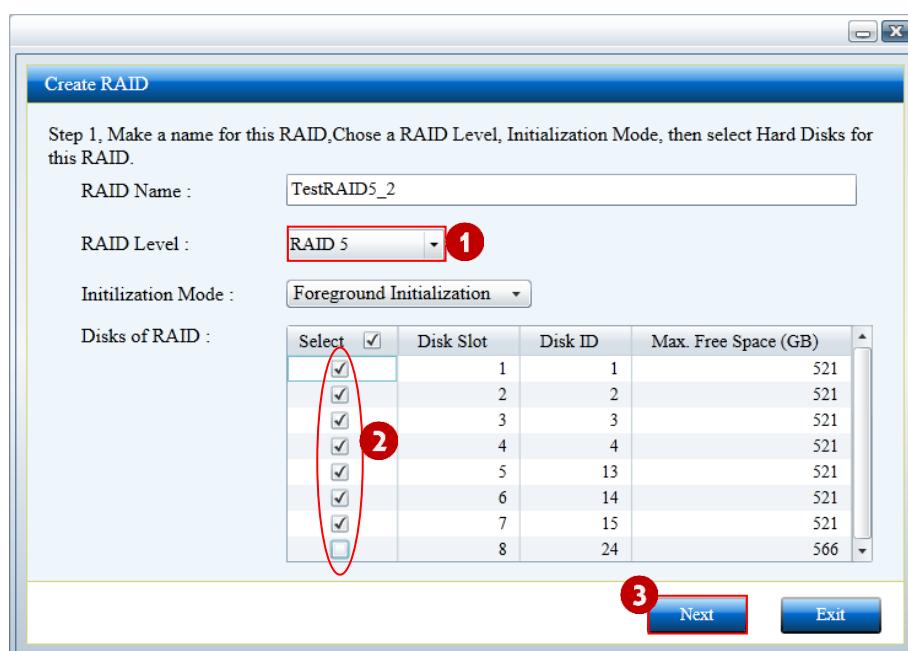

Fig. 33 Select enough amount of disks

Fig. 33 Description:

- ① Choose RAID 5 level, which needs 3 HDDs at least.
- ② 15 HDDs are selected.
- ③ The new RAID 5 volume can be created on the 15 HDDs so **Next** is enabled.

Step 6 – Choose Chunk Size

Decide chunk size of the new RAID volume. This iSCSI Storage provides two kind of chunk size as shown in following:

- ① 64K Byte : Good for smaller files storage, Database and highly random IO.
- ② 128K Byte : Good for bigger files storage and sequential IO.

Step 7 – Decide Capacity of the new RAID volume

The capacity of the new RAID volume is computed by RAID Creation Wizard, according to the selected RAID level, the amount of selected HDD, the minimum free size among the selected HDDs. Each participant HDD offers minimum 1GB. In Fig. 34, there are 7 HDDs participated the RAID 5 volume so the minimum capacity of the RAID 5 volume is 6GB ($1GB * (7-1)$), where the disappeared 1GB is used for storing XOR data. In Fig. 33, the minimum free space of these 7 HDDs is 521GB so the maximum capacity of the RAID 5 volume is 3,126 GB ($521GB * (7-1)$). Finally, in Fig. 34, the maximum capacity is 3,126 GB and the minimum capacity is 6GB. Administrator can choose a capacity between 3,126 GB and 6GB.

Moreover, if administrator chooses 3,126 GB for the RAID 5 volume, the free space of the 7 HDDs is 0GB. Hence, the HDDs without free space cannot participate in any RAID volume later.

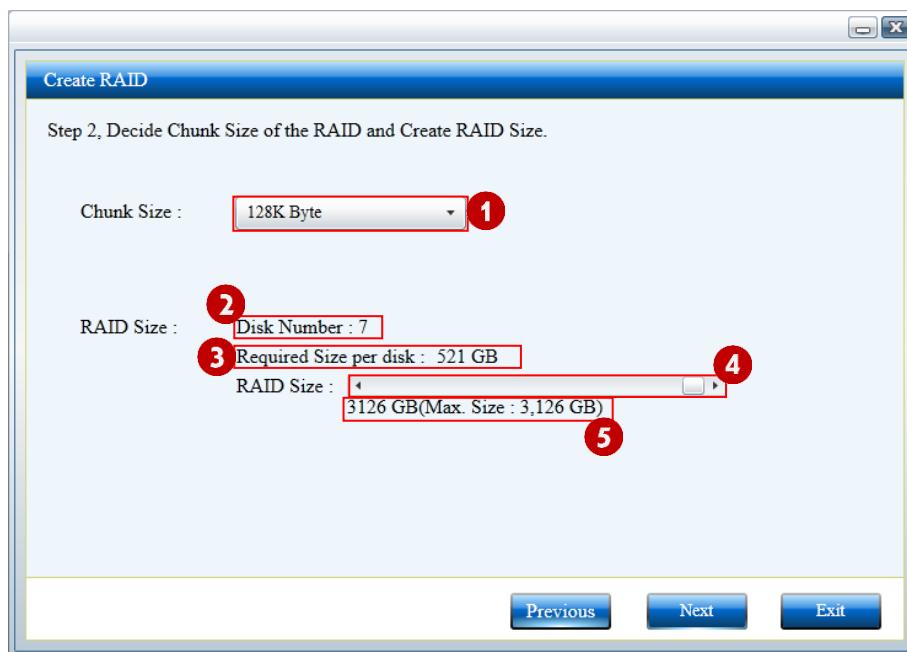

Fig. 34 Decide Chunk size and Capacity of the new RAID volume

Fig. 34 Description:

- ① Select chunk size of the new RAID volume.
- ② The amount of selected HDD
- ③ Each of selected HDD offers the capacity to the RAID volume.
- ④ Decide capacity of the new RAID volume by drawing the scroll. For example, in Fig. 34, there are 8 HDDs in the new RAID 5 volume. The capacity must be multiple of 6 GB ($1GB * 6$)

(7-1)). If administrator wants to precise configure the capacity of the volume, administrator can click bottoms at the two ends of the scroll. Click  can decrease 6 GB. Click  can increase 6 GB.

⑤ The capacity of the new RAID volume.

Step 8 – Configure Spare Disk

This iSCSI storage provides hot-spare function in RAID 1, RAID 10⁺, RAID 5 and RAID 6 and. Moreover, a RAID volume can be assigned over one spare HDD. Spare HDDs can immediately and automatically rebuild the fail HDD before administrator becomes aware of degraded RAID volumes.

At ① of Fig. 35, if any HDD can be assigned to the new RAID volume, this field is enabled. When administrator select “yes”, the ② of Fig. 35 is enabled. Administrator should choose a HDD at least.

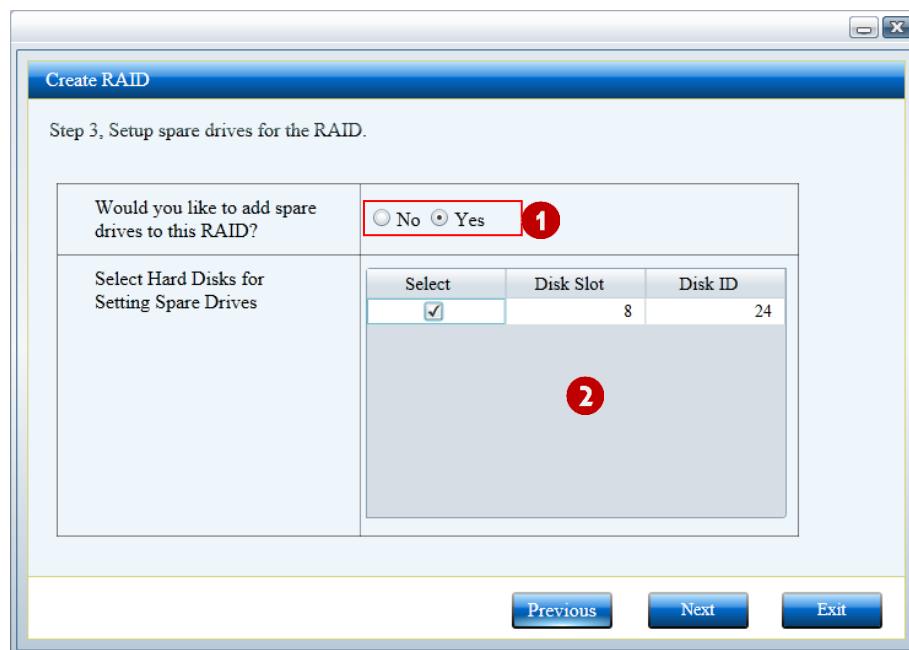

Fig. 35 Configure Spare Disk

Fig. 35 Description:

- ① Choose “Yes” and then ② is enabled.
- ② You can assign these HDDs in the RAID volume.

Step 9 – Verify Setting of The New RAID volume

Verify the setting of the new RAID volume after configuring spare HDDs. In Fig. 36 illustrate all your settings of the new RAID volume.

Step 10 – Confirm

Click  to begin initiating the new RAID volume.

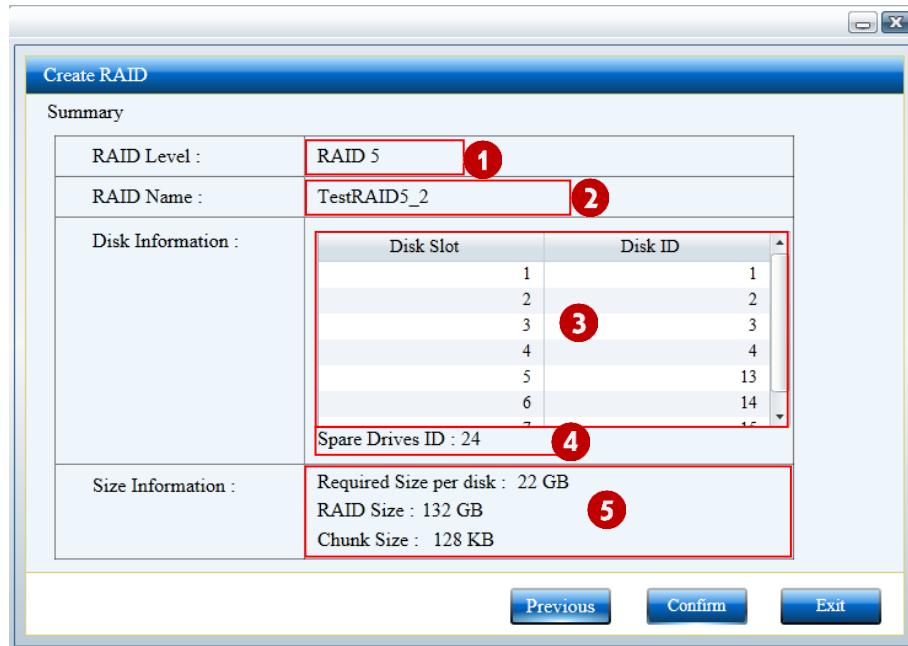

Fig. 36 The Setting of the New RAID Volume

Fig. 36 Description:

- ① The RAID level of the New RAID volume
- ② The RAID name of the New RAID volume
- ③ The participant HDD of the New RAID volume
- ④ The Spare HDDs of the New RAID volume
- ⑤ The Capacity of the New RAID Volume

After Step 10, the iSCSI Storage begin to initiate the new RAID volume immediately. Looking at RAID volume list at RAID Management, a new RAID volume record is shown in the list. The RAID status field of the record is “Initializing” and the following field, “Progress”, denotes the finishing percentage. For example, in Fig. 37, TestRAID 5 is the new RAID volume and RAID system is initializing this RAID volume. When the progress field becomes 100%, the RAID volume is ready.

Moreover, RAID system spends very short time initializing RAID 0, Single Disk and JBOD. Usually, you click **Confirm** of Step 9 and the wizard leaves. You are going to find out a ready RAID volume, created by the wizard. RAID system spends a lot of time initializing RAID 1, RAID 10⁺, RAID 5 and RAID 6.

RAID Management > Create / Delete										
<input type="checkbox"/> Select	RAID Name	RAID Level	Size (GB)	RAID Status	Progress	RAID ID	Groups	Chunk Size (KB)	Blocks	▲
<input type="checkbox"/>	TestRAID0	RAID 0	112	Ready		1	1	128	234,881,0	
<input type="checkbox"/>	TestRAID5	RAID 5	75	Ready		2	1	128	157,286,4	
<input type="checkbox"/>	TestRAID6	RAID 6	60	Ready		3	1	128	125,829,1	
<input type="checkbox"/>	TestRAID50	RAID 50+	60	Ready		4	2	128	125,829,1	
<input type="checkbox"/>	TestRAID60	RAID 60+	60	Ready		5	2	128	125,829,1	
<input type="checkbox"/>	TestRAID5_2	RAID 5	132	Initializing	3.07 %	6	1	128	276,824,0	

Fig. 37 A RAID is initiating

Fig. 37 Description:

- ① Enable Detail Information
- ② TestRAID5_2 is a new RAID volume. RAID system is initiating TestRAID5_2 so RAID status field of TestRAID5_2 is “Initializing”.
- ③ The initiated percentage of TestRAID5_2

In initializing RAID volumes, administrator can click ① to enable Detail Information. Such information includes initiated percentages of initializing disks, for example, Fig. 38 ② illustrates initiated percentages of disks. You can find out the descriptions about RAID Detail information at section 4.3.1.2。 The section describes the means of the columns.

RAID Management > Create / Delete										
<input checked="" type="checkbox"/> Select	RAID Name	RAID Level	Size (GB)	RAID Status	Progress	RAID ID	Groups	Chunk Size (KB)	Blocks	▲
<input type="checkbox"/>	TestRAID60	RAID 60+	60	Ready		5	2	128	125,829,1	
<input checked="" type="checkbox"/>	TestRAID5_2	RAID 5	132	Initializing	48.30 %	6	1	128	276,824,0	

Disk LUN

Disk used by RAID Name = TestRAID5_2

Disk used by RAID Name = TestRAID5_2										
Group ID	Disk Slot	Disk Status	Activity	Progress	Hot Spare	Disk ID				
1	1	Ready	Initializing	49.22 %	No	1				
1	2	Ready	Initializing	47.95 %	No	2				
1	3	Ready	Initializing	49.63 %	No	3				
1	4	Ready	Initializing	48.18 %	No	4				
1	5	Ready	Initializing	47.74 %	No	13				
1	6	Ready	Initializing	48.21 %	No	14				
1	7	Ready	Initializing	47.51 %	No	15				
2	8	Ready			Yes	24				

Fig. 38 The detail information of initializing RAID volume

Fig. 38 Description:

- ① The initializing RAID volume
- ② The detail information of initializing RAID volume illustrates the initializing progresses of

HDDs, participated in the RAID volume.

- ③ The activity of HDD
- ④ The initialized percentages of HDDs

After initialized the new RAID volume, RAID status field of the volume shows “Ready” and the Progress field becomes empty. Administrator can create new iSCSI LUNs in such RAID volume now. Additionally, you can enable Detail Information to observe each HDD status. You can see that all HDD become “Ready”.

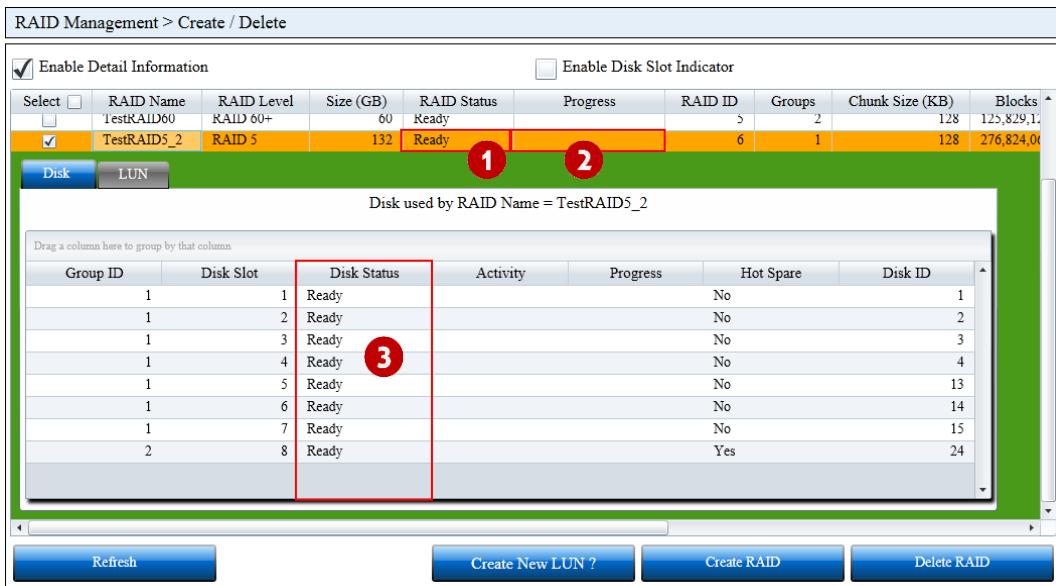

Fig. 39 The initialized process is finished.

Fig. 39 Description:

- ① RAID volume is ready to serve users when the status of the RAID volume is “Ready”.
- ② The progress bar is empty when the RAID volume is “Ready”.
- ③ Each HDD is “Ready”.

Select	RAID Name	RAID Level	Size (GB)	RAID Status	Progress	RAID ID	Groups	Chunk Size (KB)

Fig. 41 The field descriptions of RAID volume table -2

4.3.1.1. Field Descriptions of RAID Volume List

RAID Volume List lists all RAID volumes, built in the iSCSI Storage. Fig. 40 and Fig. 41 illustrate fields of the list. The fields are described as follow:

① Select

Select fields are used for deleting RAID volume. You can select multiple RAID volumes and click  to remove them.

② RAID Name

The unique name of RAID volume, this name should be a meaningful English string.

③ RAID Level

RAID level, meaning RAID volume level, denotes the RAID's working algorithm. Table 2 illustrates the features of RAID level.

④ Size (GB)

This field shows the capacity of RAID volume.

⑤ RAID Status

RAID Status field denotes status of a RAID volume. Table 3 shows all statuses of RAID volume. Administrator can quickly understand conditions of RAID volumes and do right operations when a RAID volume fails. Especially, some RAID 1, 10⁺, 5, 6 volumes are in "Degraded" situations. Administrator immediately has to replace crashed HDD with a new one. Administrator can find out the crashed HDD throughput visiting "Hard Disk Management" page and "Disk Status" page.

RAID Status	Description
Ready	The RAID volume is normal and working.
RAID Initializing	This iSCSI storage is initializing the RAID volume. Administrator can know the rate of progress by observing "Progress" field.
RAID Initiate Fail	The RAID volume fails in the initializing process. Administrator should delete the RAID volume and build a new one.
Degrade	Some participated HDD of RAID volumes have troubles. These RAID volumes are degraded and recoverable by replacing trouble HDDs with normal HDDs.
Recovering	This RAID volume is rebuilding by this iSCSI Storage. Administrator can observe the "Progress" field to know the rate of recovering progress.
Crash	This RAID volume is crashed and not recoverable.

Table 3 RAID Volume Status List

⑥ Progress

Illustrate the rate of initializing progress or rebuilding progress when this iSCSI Storage is initializing or rebuilding the RAID volume. The field is empty when the RAID volume is "Ready" and "Crash".

⑦ RAID ID

RAID ID is an unique S/N of RAID volume in this iSCSI Storage. It is important for Mass Entry Function. Administrator should write an Excel file with a table. Such table has to include 5 columns, User Name, Target Name, LUN Name, LUN Size and RAID ID. Where the RAID ID denotes the RAID volume, where the LUN builds in.

⑧ Groups

This field is just for RAID 10+ volumes, which support Multi-group function. Please reference Table 2 to understand Multi-group function of RAID volume.

⑨ Chunk Size (KB)

Denote the Chunk Size of RAID volume.

⑩ Blocks

Denote the number of block, included in the RAID volume.

⑪ Block Size (Byte)

Denote the size of Block in the RAID volume. This value is usually 512 bytes.

⑫ Unit Size (MB)

Denote the unit size of RAID volume. This value is usually 1,024 MB. It means that the capacity of RAID volume must be a multiple of 1024MB.

⑬ Adding Time

Denote the built time of RAID volume.

⑭ Update Time

Denote the last updated time of RAID volume.

4.3.1.2. Detail Information of RAID Volume

Select “Enable Detail Information” and left-click a RAID volume record in RAID volume list by mouse. RAID volume list shows the detail information under the RAID volume record, such as ① of Fig. 42, where ③ is HDD information of the RAID volume.

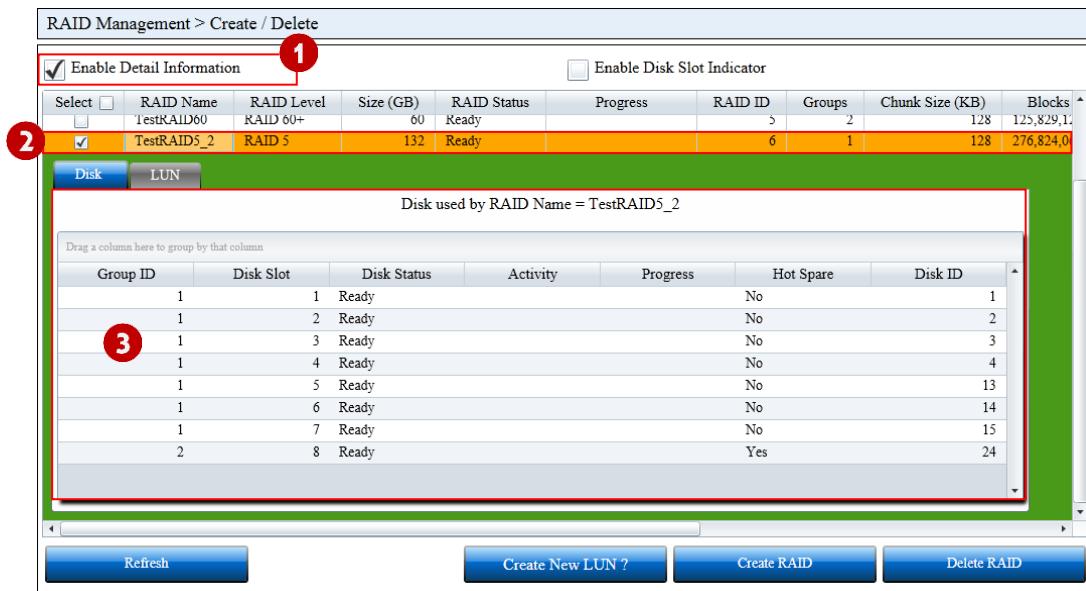

Fig. 42 The detail information of a RAID volume

Fig. 42 Description:

- ① Enable illustrating detail information of RAID volumes.
- ② Click a RAID volume for illustrating the detail information.
- ③ The detail information table of the RAID volume

The detail information is in ③ of Fig. 42. The follows are the descriptions of columns.

① Group ID

Denote the Group IDs of groups in the RAID volume. Table 4 shows the grouping rules of different levels.

RAID Level	Grouping Rule
RAID 0	Only one group.
RAID 1	Only one group and the group includes 2 HDDs.
RAID 10 ⁺	2 Groups at least and each group includes 2 HDDs. Because this iSCSI Storage has RAID 10 ⁺ function, a RAID 10 ⁺ volume may have > 2 groups.
RAID 5	Only one group.
RAID 6	Only one group.
Single Disk	Only one group.
JBOD	Only one group.

Table 4 The Group Rules of RAID Level

② Slot

This iSCSI Storage has 16 SAS / SATA slots. The storage identifies the slot by number 1~8, as shown in Fig. 26. This field denotes the physical location of HDDs.

③ Disk Status

Denote the current HDD status. Please reference Table 1 to understand all conditions of HDDs.

④ Activity

Denote the current activity of a HDD. There are two possible activities in this field, Initializing and Recovering.

⑤ Progress

This field shows progress bar for denoting the rate of progress when this HDD is being Initialized and Recovered.

⑥ Hot Spare

Denote a HDD whether this HDD is a spare HDD or not.

Hot Spare	Description
No	This HDD is not a Spare HDD of the RAID volume.
Yes	This HDD is a Spare HDD of the RAID volume.

Table 5 Spare HDD Flag

⑦ Disk ID

The unique S/N in this iSCSI Storage denotes an initialized HDD. Administrator must initialize HDDs, used in this iSCSI Storage. The Storage gives every initialized HDD a unique and non-zero S/N. if a HDD's Disk ID is 0, the HDD must be a non-initialized HDD.

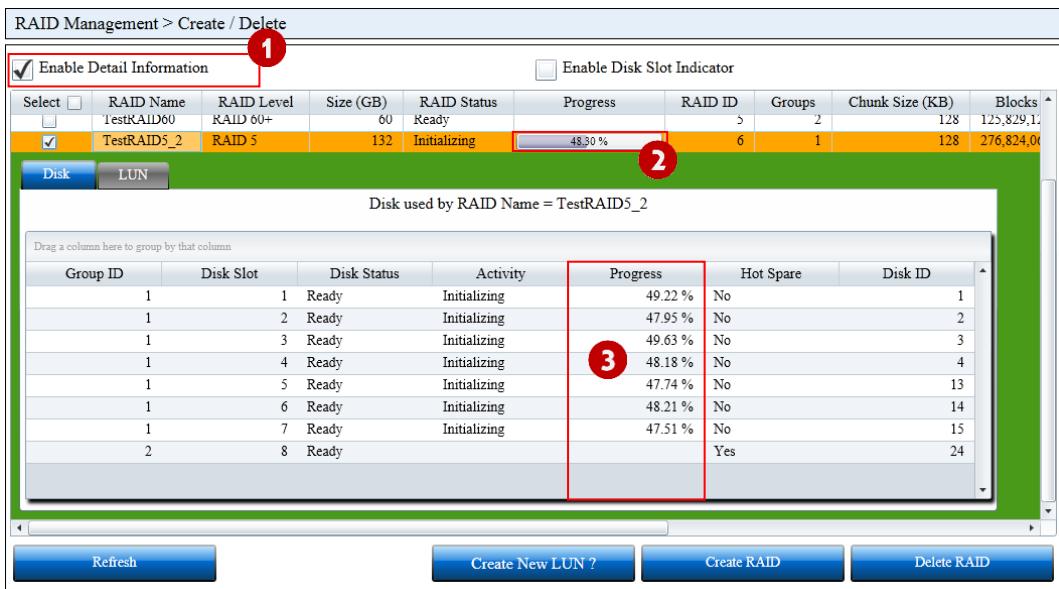

Fig. 43 The detail information of an initializing RAID volume

Fig. 43 Description:

- ① Enable illustrating detail information of a RAID volume.
- ② The initializing progress percentage of the clicked RAID volume
- ③ The initializing progress percentages of every HD, participated in the initializing RAID volume

This iSCSI Storage supports iSCSI Disk Virtualization function. The storage can divide a RAID volume into many iSCSI LUNs. Hence, A RAID volume's detail information illustrates which iSCSI LUNs are in the RAID volume. In Fig. 44, the LUN table shows all iSCSI LUNs, created in the RAID volume. The follows are the descriptions of every column.

① LUN Name

LUN Name, named by Administrator, is a unique name. Please give every iSCSI LUNs meaningful names for easily managing in the future.

② LUN Alias

LUN Alias Name, named by the LUN's owner, is not a unique name. A User gives the user's iSCSI LUN a meaningful name for showing purposes of the iSCSI LUN.

③ LUN ID

LUN ID is a unique number of iSCSI LUN.

④ Description

Administrator should use a string to describe an iSCSI LUN for future managements.

⑤ Size

The size of iSCSI LUN.

⑥ Status

Denote whether an iSCSI LUN is enabled or not. If the value is "Enable", the iSCSI LUN is available for its owner. Else, the iSCSI LUN is not available.

⑦ Target Name

Denote an iSCSI Target, which holds the iSCSI LUN.

⑧ Target ID

Denote an iSCSI Target, which holds the iSCSI LUN.

<input checked="" type="checkbox"/>	TestRAID5_2	RAID 5	208	Ready		6	1	128	436,207,6

Fig. 45 Delete a RAID volume

Fig. 45 Description:

- ① Select a RAID volume
- ② Click **Delete RAID** to delete the selected RAID volume

4.3.3. Configure Spare HDD

Steps of Adding Spare HDD:

- (1) Go to “Spare Drives” Page
- (2) Select a RAID 1, RAID 10⁺, RAID 5 or RAID 6 volume in the existed RAID volume list at Right-top Field, as shown in Fig. 46 ①.
- (3) Select unselected HDDs in the HDD list at Right-bottom Field, as shown in Fig. 46 ②
- (4) Click **Confirm**

Steps of Removing Spare HDD:

- (1) Go to “Spare Drives” Page
- (2) Select a RAID 1, RAID 10⁺, RAID 5 or RAID 6 volume in the existed RAID volume list at Right-top Field, as shown in Fig. 46 ①.
- (3) Select selected HDDs in the HDD list at Right-bottom Field, as shown in Fig. 46 ②
- (4) Click **Confirm**

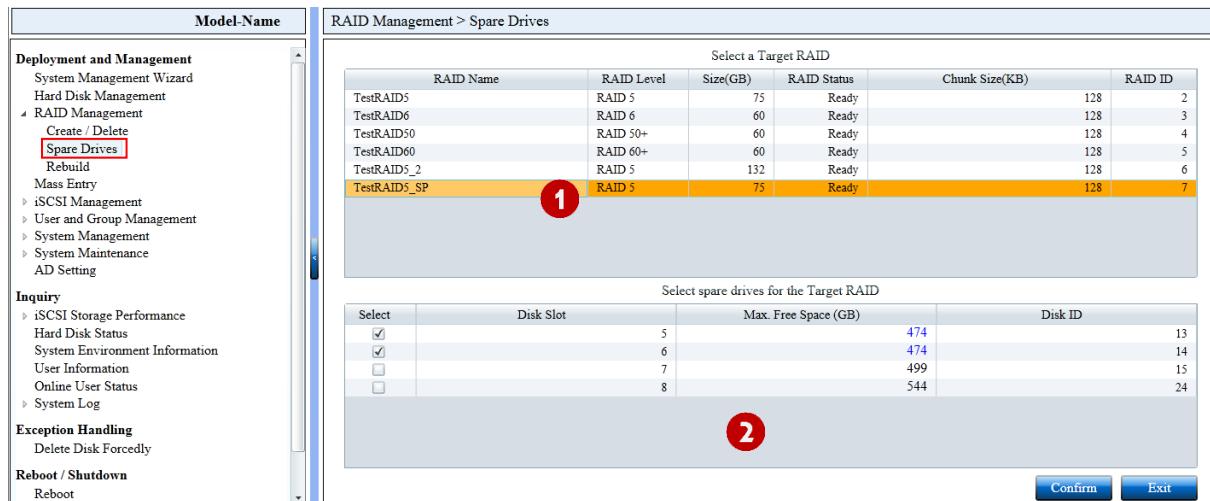

Fig. 46 Configure spare disks for existing RAID volumes

Fig. 46 Description:

- ① This table illustrates existed RAID volumes, which are built by RAID 5, RAID 6. You can click one RAID volume and then the lower table shows which HDDs are the RAID volume's spare HDDs and which HDDs can be the RAID volume's spare HDDs.
- ② The selected HDDs are spare HDDs of the RAID volume. The unselected HDDs can be the RAID volume's spare HDDs.

4.3.4. Rebuild RAID Volumes

This iSCSI Storage provides two Rebuild RAID Volume processes, as shown in follows:

1. Auto-Rebuild:

- (1) Enable RAID Auto-Recovery in System Setting Page
- (2) Remove crashed HDD from the slot
- (3) Plug a new HDD in the slot. The capacity of the new HDD must be larger than or equal to that of the crashed one.
- (4) The iSCSI Storage will rebuild all rebuildable RAID volumes.

2. Manual Rebuild:

- (1) Disable RAID Auto-Recovery in System Setting Page
- (2) Select a Degrade RAID volume and Enable Detail Information
- (3) Find out the crashed HDD, as shown in Fig. 47
- (4) Remove the crashed HDD from the slot
- (5) Plug a new HDD in the slot
- (6) Initial the new HDD by "Disk Management" Page, as shown in
- (7) Go to "Rebuild" page
- (8) Select Recover by RAID. Go to step (9)
- (9) Select Recover by Disk. Go to step (12)
- (10) Select a degraded RAID volume in the top field, as shown in Fig. 47 ②.
- (11) Select a HDD in the bottom field, as shown in Fig. 47 ③.
- (12) Click **Confirm** to begin recovering the RAID volume.
- (13) Select a HDD in the top field, as shown in Fig. 49 ①.
- (14) Select a degraded RAID volume in the bottom field, as shown in Fig. 49 ②.
- (15) Click **Confirm** to begin recovering the RAID volume.

Confirm

Fig. 48 Recover by RAID

Fig. 48 Description:

- ① Select a degraded RAID volume and RAID System shows which HDD can recover the RAID volume.
- ② Degraded RAID volume
- ③ Such HDDs can recover the selected RAID volume.

Fig. 49 Recover by Disk

Fig. 49 Description:

- ① List all HDDs in this iSCSI Storage. Please select one.
- ② List degraded RAID volumes, which are recoverable by the HDD, selected in ①.

4.4. Mass-entry Users、iSCSI Targets、iSCSI LUNs

Steps of Mass-entry:

- (1) Download Mass-entry template file from Fig. 50 ①.
- (2) Edit the template file.
- (3) Upload the template file to the iSCSI storage.
- (4) Click **Confirm** to create users, iSCSI Targets and iSCSI LUNs.

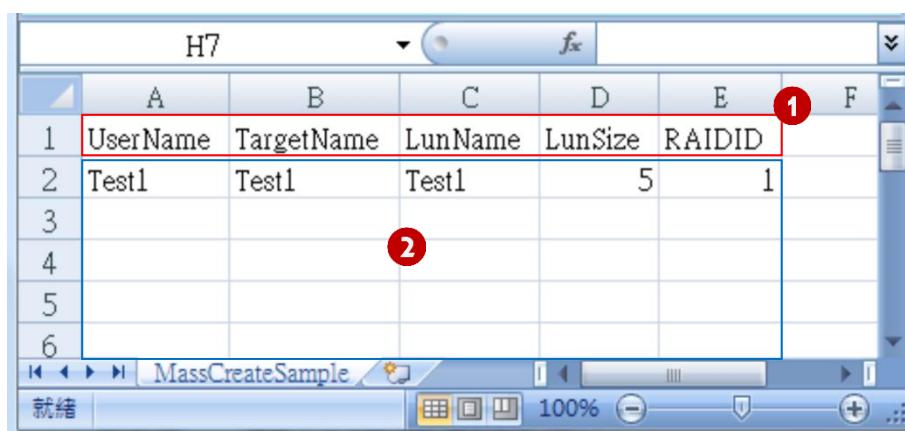

Fig. 50 Mass entry Users, iSCSI Targets and iSCSI LUNs

Fig. 50 Description:

- ① Download template file from an iSCSI storage.
- ② Upload mass-entry file to the iSCSI storage.
- ③ Click  to mass-entry.

Description of Mass-entry file:

- (1) Open the template file by Excel.
- (2) Please do not edit the first raw of the template file.
- (3) Field – UserName: this field denotes the iSCSI target's owner. If the UserName is existed in the iSCSI Storage, the storage does nothing. Else, the storage is going to create the username.
- (4) Field – TargetName: this field denotes the iSCSI LUN's holder. If the TargetName is existed in the iSCSI Storage, the storage does nothing. Else, the storage is going to create the iSCSI Target and assign the new target to the username.
- (5) Field – LunName: the field denotes the name of new iSCSI LUN. The name must be unique.
- (6) Field – LunSize: the field denotes the capacity of iSCSI LUN.
- (7) Field – RAID ID: the field denotes a RAID volume in the iSCSI storage. The new iSCSI LUN will be built on the RAID volume.

	A	B	C	D	E	F

Fig. 51 Description:

- ① Do not edit this field
- ② Mass-entry records

4.5. iSCSI Management

4.5.1. LUN Configuration

4.5.1.1. Create iSCSI LUNs

Steps of creating an iSCSI LUN:

- (1) Go to “LUN Setting” Page
- (2) Select a RAID volume. Please ensure the free space of the RAID volume is enough for creating a new iSCSI LUN.
- (3) Name the new iSCSI LUN.
- (4) Describe the new iSCSI LUN (Optional)

(5) Decide the Size of the iSCSI LUN
 (6) Click 

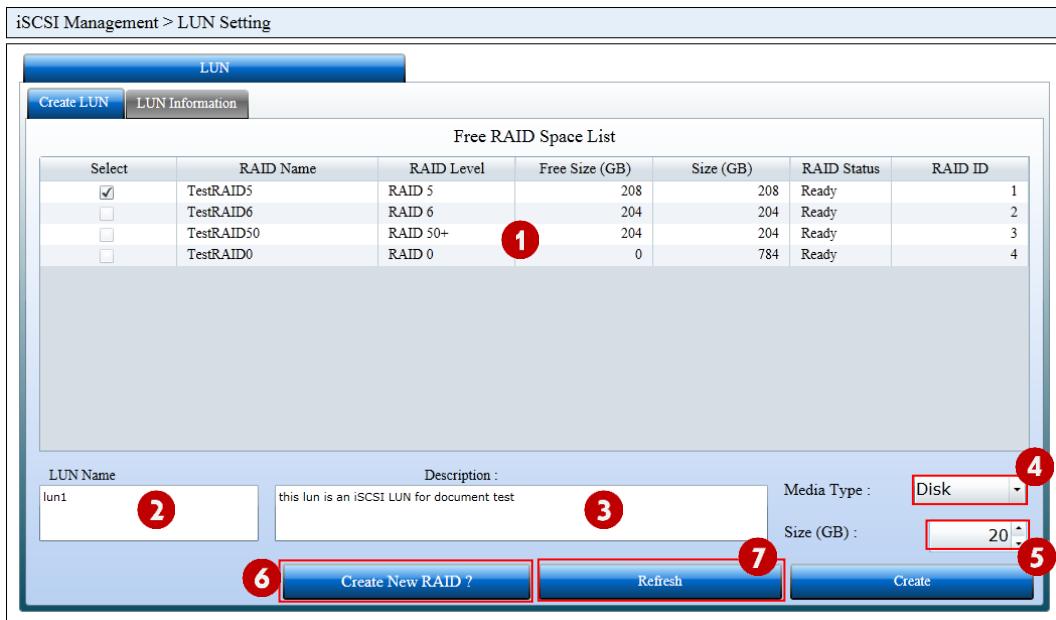

Fig. 52Create an iSCSI LUN

Fig. 52 Description:

- ① RAID Volume List
- ② Name of new iSCSI LUN
- ③ Description of iSCSI LUN
- ④ LUN Type
- ⑤ Size of the new iSCSI LUN
- ⑥ Go to Create/Delete RAID page
- ⑦ Rescan the existed RAID volumes

4.5.1.2. Modify iSCSI LUNs

Steps of modifying an iSCSI LUN

- (1) Go to “LUN Setting” Page
- (2) Then, go to “LUN Information” Page
- (3) Select an existed iSCSI LUN from the iSCSI LUN list.
- (4) Click  button
- (5) Edit LUNName (optional)
- (6) Edit Description (optional)
- (7) Extend Size of the iSCSI LUN (optional)
- (8) Click 

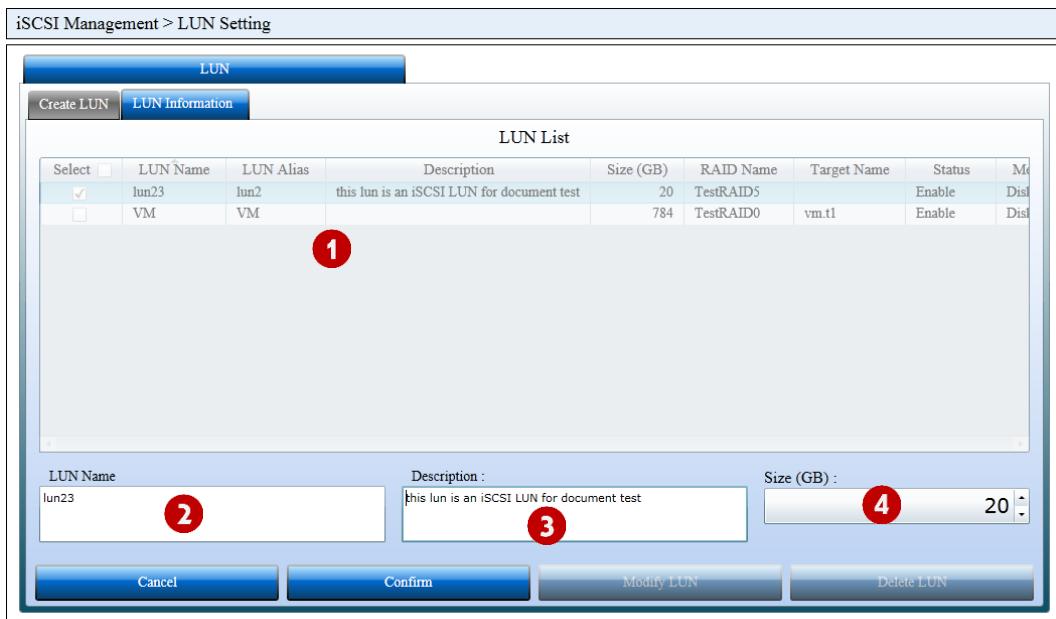

Fig. 53 Edit an existed iSCSI LUN

Fig. 53 Description:

- ① Select an iSCSI LUN and click **Modify LUN**. ② ③ ④ fields become editable.
- ② Edit iSCSI LUN Name
- ③ Edit iSCSI LUN Description
- ④ Extend the size of iSCSI LUN

4.5.1.3. Delete iSCSI LUNS

Steps of deleting an iSCSI LUN

- (1) Go to “LUN Setting” Page
- (2) Then, go to “LUN Information” Page
- (3) Select an existed iSCSI LUN from the iSCSI LUN list.
- (4) Click **Delete LUN** button

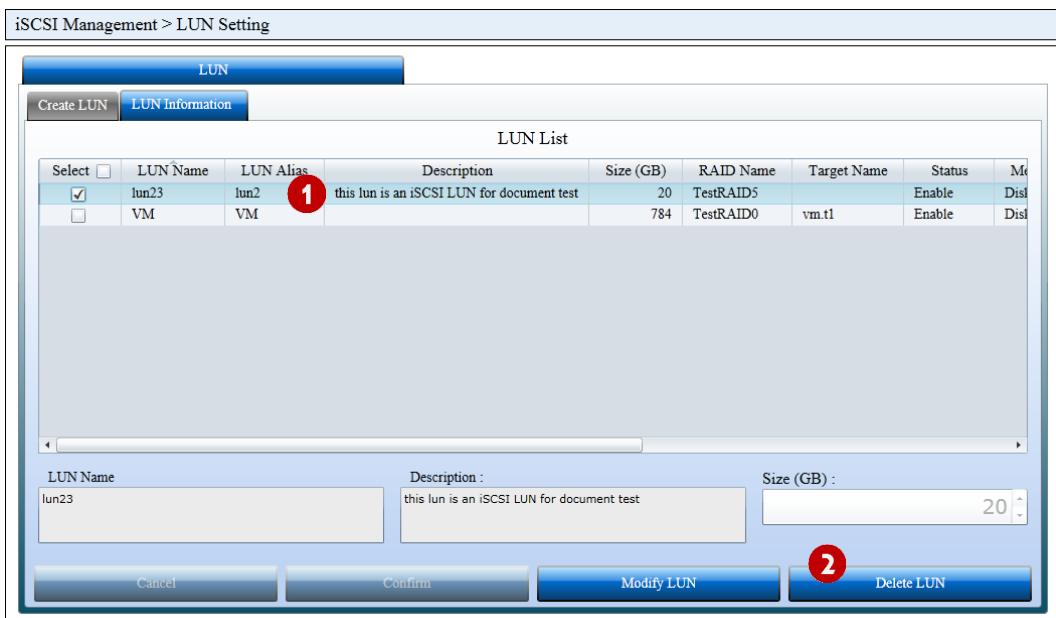

Fig. 54 Delete iSCSI LUNs.

Fig. 54 Description:

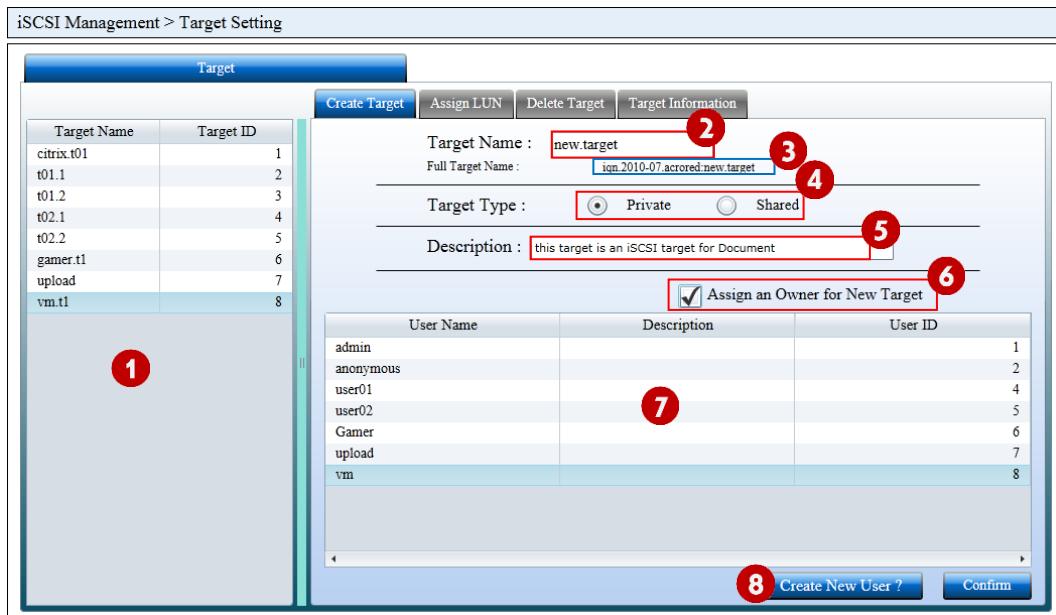

- ① Select an iSCSI LUN
- ② Click 

4.5.2. Target Configuration

4.5.2.1. Create New iSCSI Targets

Steps of creating a new iSCSI Target:

- (1) Go to “Target Setting” page.
- (2) Type a new target name in Fig. 55 ②.
- (3) Decide “Target Type” in Fig. 55 ④.
- (4) Describe the new iSCSI Target in Fig. 55 ⑤. (optional)
- (5) Decide the owner of the new iSCSI Target in Fig. 55 ⑥ and ⑦. (optional)
- (6) Click 

Target Name	Target ID
citrix.t01	1
t01.1	2
t01.2	3
t02.1	4
t02.2	5
gamer.t1	6
upload	7
vm.t1	8

Target Name : **new.target** **2**
Full Target Name : **iqn 2010-07.acored:new.target** **3**
Target Type : **Private** **4** **Shared**
Description : **this target is an iSCSI target for Document** **5**
 Assign an Owner for New Target **6**

User Name	Description	User ID
admin		1
anonymous		2
user01		4
user02		5
Gamer		6
upload		7
vm		8

8 Create New User? **Confirm**

Fig. 55 Create a New iSCSI Target

Fig. 55 Description:

- ① Existed iSCSI Target
- ② Target Name of new iSCSI Target
- ③ The full name of the iSCSI Target
- ④ Target type
- ⑤ Description of the new iSCSI Target
- ⑥ Does you assign owner to the new iSCSI Target now?
- ⑦ The list of existed users
- ⑧ Connect to “User Management” page

4.5.2.2. Assign LUNs to iSCSI Targets

Steps of assigning LUNs to iSCSI targets:

- (1) Go to “Target Setting” Page
- (2) Go to “Assign LUN” Page
- (3) Select an iSCSI Target from existed iSCSI Target List, as shown in Fig. 56 ①.

- (4) Select an iSCSI LUN in Fig. 56 ⑥.
- (5) Click 
- (6) Click 

Fig. 56 Assign iSCSI LUN to iSCSI Targets

Fig. 56 Description:

- ① Existed iSCSI Targets
- ② An iSCSI Target's iSCSI LUNs
- ③ Assign the selected iSCSI LUN in Fig. 56 ⑥ to the selected iSCSI target.
- ④ Remove the selected iSCSI LUN in Fig. 56 ② from the selected iSCSI target.
- ⑤ Go to "LUN Setting" page.
- ⑥ The list of free iSCSI LUNs.

4.5.2.3. Delete Target

Steps of deleting iSCSI targets:

- (1) Go to "Target Setting" Page
- (2) Go to "Delete Target" Page
- (3) Select an iSCSI Target in Fig. 57 ①.
- (4) Click 

iSCSI Management > Target Setting						
Target		Target				
		Create Target	Assign LUN	Delete Target	Target Information

4.6. User and Group Management

4.6.1. User Setting

4.6.1.1. Create New Users

Steps of creating a new user:

- (1) Go to “User Setting” page
- (2) Go to “Create User”
- (3) Input the username, which has to be a unique username.
- (4) Decide the privilege of new user.
- (5) Describe the new user by a short string
- (6) Click **Confirm**

User and Group Management > User Setting

Username	User ID

- ❶ Existed user list
- ❷ The username of new user
- ❸ Default Password = “000000000000” (twelve 0)
- ❹ The Privilege of new user, “General” or “Administrator”
- ❺ The Description of new user

4.6.1.2. Assign Targets to Users

Steps of assigning targets to users:

- (1) Go to “User Setting” Page
- (2) Go to “Assign Target” Page
- (3) Select a user in Fig. 59 ❶.
- (4) Select a free iSCSI Target in Fig. 59 ❻.
- (5) Click 
- (6) Click 

Steps of removing targets from users:

- (1) Go to “User Setting” Page
- (2) Go to “Assign Target” Page
- (3) Select a user in Fig. 59 ❶.
- (4) Select a held iSCSI Target in Fig. 59 ❷.
- (5) Click 
- (6) Click 

Fig. 59 Assing targets to users

Fig. 59 Description:

- ① Existed users
- ② The held iSCSI Targets of the selected user
- ③ Assign a selected iSCSI Target, listed in Fig. 59 ⑥, to the user
- ④ Remove a selected iSCSI Target, listed in Fig. 59 ②, from the user
- ⑤ Go to “Target Setting” Page
- ⑥ The free iSCSI Targets in this iSCSI Storage.

4.6.1.3. Modify User Information

Steps of modifying user information:

- (1) Go to “User Setting” page
- (2) Go to “Modify User” page
- (3) Modify user’s privilege (optional)
- (4) Reset password when the user forgets his/her password (optional)
- (5) Modify user’s description (optional)

User and Group Management > User Setting

- ① Existed users
- ② Username, but you cannot modify it.
- ③ User's privilege
- ④ Reset user's password back to 000000000000 (twelve 0)
- ⑤ Modify user's description

4.6.1.4. Enable User and Disable User

Steps of enabling and disabling users:

- (1) Go to “User Setting” Page
- (2) Go to “Active User” Page
- (3) Select a user in Fig. 61 ①
- (4) Activate or deactivate the user at Fig. 61 ③

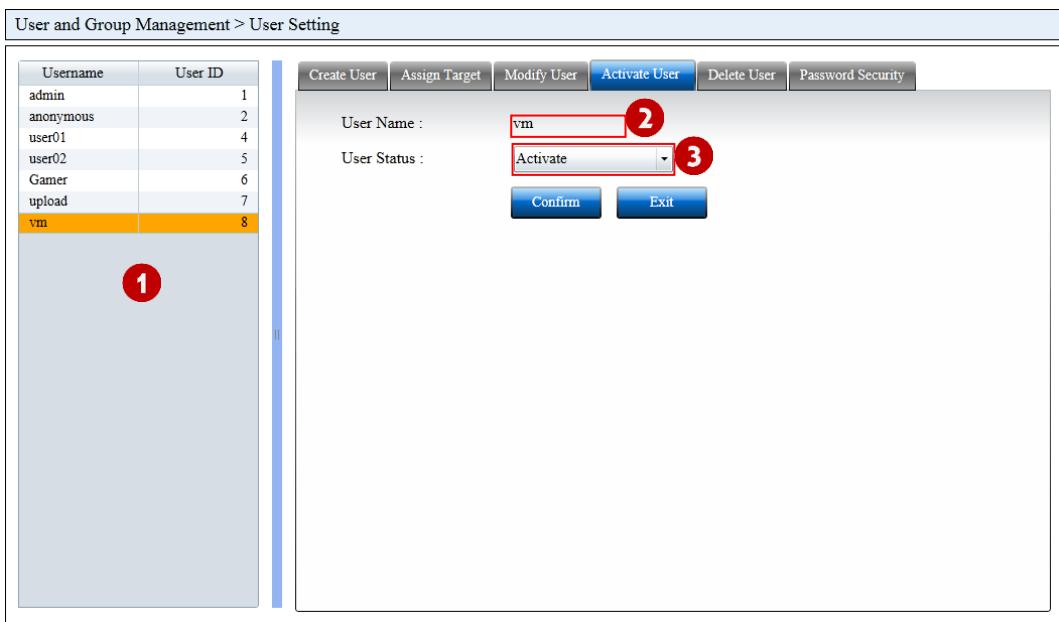

Fig. 61 Activate and Deactivate users

Fig. 61 Description:

- ① The existed user list
- ② The selected user
- ③ Activate or deactivate a user

4.6.1.5. Delete Users

Steps of deleting users:

- (1) Go to “User Setting” page
- (2) Go to “Delete User” page
- (3) Select user accounts, which you want to delete
- (4) Click **Confirm**

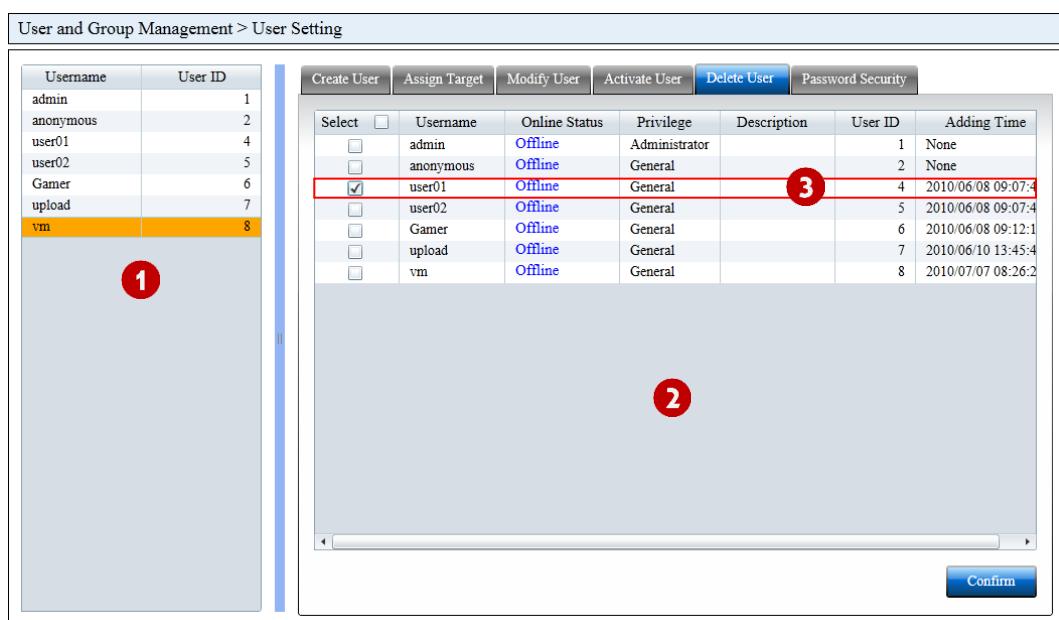

Fig. 62 Delete users

Fig. 62 Description:

- ① The existed user list
- ② The detail and selectable existed user list
- ③ The selected user

4.6.1.6. Unlock Users

A user account is locked because the user uses some wrong passwords to login the management system for 4 times. Administrator can unlock the account by following steps:

- (1) Go to “User Setting” Page
- (2) Go to “Password Security” Page
- (3) Select “Locked” users
- (4) Click 

User and Group Management > User Setting						
Username		User ID		Password Security		
Create User		Assign Target		Modify User		Activate User
Select	<input type="checkbox"/>	Username	Security Status	Privilege	Description	User ID
<input type="checkbox"/>	admin	Unlocked	Administrator			1

<input type="checkbox"/>	vm	Unlocked	General			8

Fig. 63 Unlock the locked users

Fig. 63 Description:

- ① The locked users
- ② The normal users
- ③ Unlock the selected locked users

4.6.2. Group Setting

4.6.2.1. Create a New Group

Steps of creating new groups:

- (1) Go to “Group Setting” page
- (2) Go to “Create Group” page
- (3) Enter a name of new group
- (4) Describe the new group by a string (optional)
- (5) Click 

User and Group Management > Group Setting

Group Name	Group ID
new.group01	1
new.group02	2

Create Group **Assign User** **Assign Target** **Delete Group** **Group Information**

Group Name: **new.group03** **2**

Group Description: This is a new group, named new.group03 **3**

Confirm **Exit**

Fig. 64 Create new groups

Fig. 64 Description:

- ① The existed group list
- ② New group name
- ③ The description to describe the new group

4.6.2.2. Assign Users

Steps of assigning users to a group:

- (1) Go to “Group Setting” page
- (2) Go to “Assign User” page
- (3) Select a group in Fig. 65 ①.
- (4) Select a user in Fig. 65 ②.
- (5) Click 
- (6) Click 

Steps of removing users from a group:

- (1) Go to “Group Setting” Page
- (2) Go to “Assign User” Page
- (3) Select a group in Fig. 65 ①.
- (4) Select a user in Fig. 65 ②.
- (5) Click 
- (6) Click 

Fig. 65 Assign users to a group

Fig. 65 Description:

- ① The existed groups list
- ② The users, who are members of the selected group
- ③ Assign a selected user in ⑥ to the selected group
- ④ Remove a selected user in ② from the selected group
- ⑤ Go to “Create user” page
- ⑥ The users, who are not members of the selected group

4.6.2.3. Assign Shared Targets

Steps of assigning shared targets to a group:

- (1) Go to “Group Setting” page
- (2) Go to “Assign Target” page
- (3) Select a group in Fig. 66 ①.
- (4) Select shared targets in Fig. 66 ⑥.
- (5) Click 
- (6) Click 

Steps of removing shared targets from a group:

- (1) Go to “Group Setting” Page
- (2) Go to “Assign Target” Page
- (3) Select a group in Fig. 66 ①.
- (4) Select shared targets in Fig. 66 ②.
- (5) Click 
- (6) Click

4.7. System Management

4.7.1. Modify Admin Password

Steps of modifying Admin password:

- (1) Go to “Administrator Password” Page
- (2) Enter the old admin password
- (3) Enter the new admin password
- (4) Enter the new admin password again
- (5) Click Confirm

System Management > Administrator Password

User Name :	admin
Current Password :	<input type="password"/> 1
New Password :	<input type="password"/> 2
Confirm New Password :	<input type="password"/> 3
<input type="button" value="Confirm"/>	

Fig. 68 Modify Admin's password

Fig. 68 Description:

- ① Enter the old password
- ② Enter the new password
- ③ Enter the new password again

4.7.2. Modify Storage Name

Steps of modifying storage name and description:

- (1) Go to "Storage Name" Page
- (2) Modify the storage name field
- (3) Modify the description of storage\
- (4) Click

System Management > Storage Name

Storage Name :	<input type="text" value="iSCSISorage"/> 1
Storage Description :	<input type="text" value="Modify Description"/> 2
<input type="button" value="Confirm"/> <input type="button" value="Exit"/>	

Fig. 69 Modify storage name and description

Fig. 69 Description:

- ① Modify the storage name
- ② Modify the description of storage

4.7.3. Modify Maximum Connections

Steps of modifying maximum connections:

- (1) Go to “Maximum Connections” Page
- (2) Modify the amount of maximum iSCSI connection
- (3) Click **Confirm**

System Management > Maximum Connections

Storage Name : iSCSIStorage

Storage Description :

Maximum Connections : ①

Confirm **Exit**

Fig. 70 Modify the maximum iSCSI connections

Fig. 70 Description:

- ① Setup the amount of iSCSI connection

4.7.4. Modify IP Addresses

Steps of modifying IP addresses:

- (1) Go to “ IP Address” Page
- (2) Select a network interface (NIC 1~NIC6)
- (3) Enable VLAN (optional)
- (4) Setup VLAN ID (optional)
- (5) Configure IPv4 IP address, go to (7)
- (6) Configure IPv6 IP address, go to (9)
- (7) Configure IPv4 Network Mask
- (8) Configure IPv4 Gateway
- (9) Setup Jumbo Frame (optional)
- (10) Configure IPv4 External IP (optional)
- (11) Configure External Port (optional)
- (12) Select “DNS” page (optional)
- (13) Configure DNS (optional)

System Management > IP Address

Name	IP v4 Address	IP v4 Mask	IP v4 Gateway	IP v4 DNS 1	IP v4 DNS 2
NIC 1	192.168.88.181	255.255.255.0	192.168.88.1	168.95.1.1	
NIC 2	192.168.88.182	255.255.255.0	192.168.88.1	168.95.1.1

Fig. 71 Modify IP addresses

Fig. 71 Description:

- ① The list of Ethernet interfaces
- ② Enable trunking function of Ethernet interfaces
- ③ Enable VLAN function
- ④ Configure VLAN ID
- ⑤ IPv4 Configuration and IPv6 Configuration
- ⑥ Jumbo frame configuration
- ⑦ Configure External IP if your iSCSI storage is into a private network segment.

Steps of configuring trunk network:

- (1) Go to “ IP Address” Page
- (2) Enable Network port trunking
- (3) Select “Bound 1”
- (4) Choose “Port Trunking Mode”
- (5) Configure IPv4 IP address
- (6) Configure IPv4 Mask
- (7) Configure IPv4 Gateway
- (8) Configure IPv4 External IP address (optional)
- (9) Configure External Port (optional)
- (10) Select “DNS” page (optional)
- (11) Configure DNS (optional)

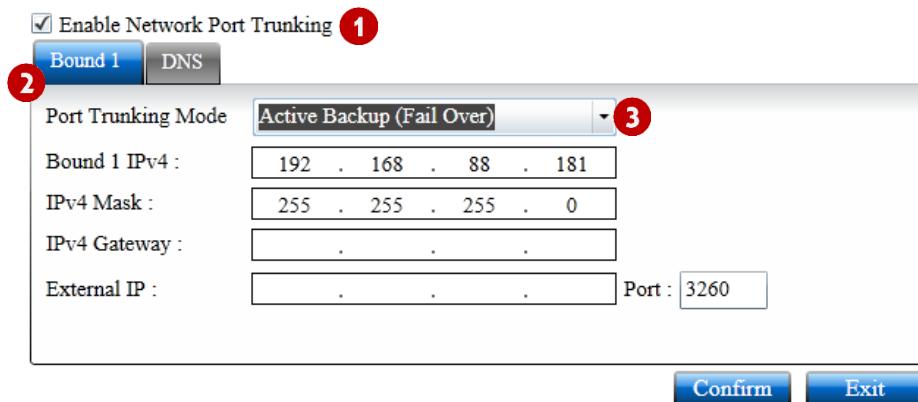

Fig. 72 Configure Network Trunk

Fig. 72 Description:

- ① Enable Network port trunk
- ② Trunked network interface: Bound 1
- ③ Choose trunking mode

4.7.5. Time Zone, Date and Time of iSCSI storage

Steps of configure Time Zone, Date and Time:

- (1) Go to “System Clock” Page
- (2) Setup Time Zone
- (3) Setup Date
- (4) Setup Time
- (5) Click 

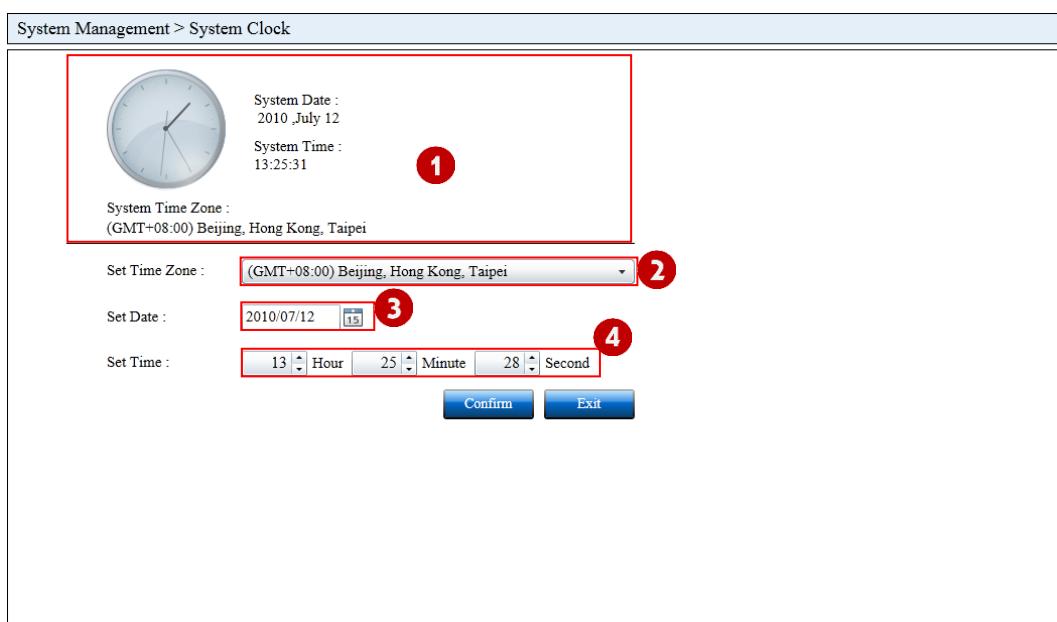

Fig. 73 Setup Time Zone, Date and Time

Fig. 73 Description:

- ① Illustrate the Time Zone, Date and Time in the iSCSI Storage
- ② Setup Time Zone
- ③ Setup Date
- ④ Setup Time

4.7.6. Setup Accessible Network Segment

Steps of setting up accessible network segment for Administrator and general users:

- (1) Go to “Login Privilege” Page
- (2) Modify the accessible network segment for Administrator
- (3) Modify the accessible network segment for general users
- (4) Click 

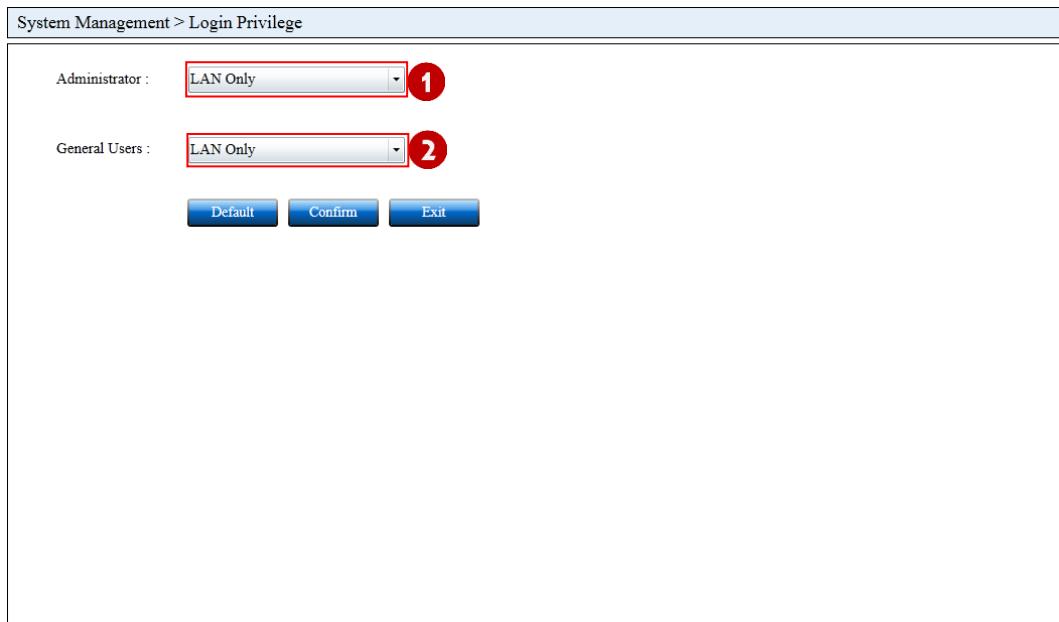

Fig. 74 Configure Accessible Network Segment of Administrator and general users

Fig. 74 Description:

- ① Decide where Administrator can login to the iSCSI storage from.
- ② Decide where general can login to the iSCSI storage from.

4.7.7. System Notification

Steps of configuring System Notification

- (1) Go to “System Notification” Page
- (2) Setup SMTP Server’s IP address or Domain Name
- (3) Setup SMTP Server’s Port Number
- (4) Enable SMTP authentication (optional)
- (5) User Name of SMTP server (optional)
- (6) Password of the user at SMTP server (optional)
- (7) The first Email Address of Administrator
- (8) The second Email Address of Administrator (optional)
- (9) Enable SSL/TLS secure connection (optional)
- (10) Schedule of event notification
- (11) Send testing Email to Administrator (optional)
- (12) Click 

System Management > Notification

Notification

SMTP Server :	mail.acrored.com	①
Port :	25	②
Enable SMTP Authentication :	<input checked="" type="checkbox"/>	③

Use SSL/ TLS secure connection :	<input checked="" type="checkbox"/>	⑧
Daily Notify Time :	07:00	⑨

Send a test mail when "Confirm". 

Confirm

Fig. 75 Modify events notification by Email

Fig. 75 Description:

- ① Email server's IP address or Domain Name, where the Email server can send event messages to Administrator's Email.
- ② SMTP port number
- ③ Enable SMTP authentication
- ④ User account at the SMTP server
- ⑤ The user account's password at the SMTP server
- ⑥ The first E-mail address of Administrator
- ⑦ The Second E-mail address of Administrator
- ⑧ Enable SSL/TLS connection
- ⑨ Schedule of event notification
- ⑩ Send test mail to the first and second Email address of Administrator after "Confirm"

4.7.8. System Environment Information

Steps of configuring system environment information

- (1) Go to "System Environment Information" page
- (2) Click High Limit Fields to configure the thresholds of temperatures
- (3) Enable/Disable temperature monitors
- (4) Click Low Limit Field to configure the thresholds of Fan speed
- (5) Enable/Disable temperature monitors
- (6) Click High Limit Field and Low Limit Field to configure the threshold of voltages
- (7) Enable/Disable voltage monitors
- (8) Click **Confirm**

System Management > System Environment Information

Host System Environment Information

1. System Temperature (°C / °F) :

Item	Current Value	High Limit	Enable
Motherboard	30	60	<input checked="" type="checkbox"/>
CPU1	35	60	<input checked="" type="checkbox"/>

2.

2. Fan Speed (RPM) :

Item	Current Value	Low Limit	Enable
Fan1	5,947	4,000	<input checked="" type="checkbox"/>
Fan2	5,769	4,000	<input checked="" type="checkbox"/>
Fan3	5,947	4,000	<input checked="" type="checkbox"/>

4.

Confirm

Fig. 76 Configure system environment information monitor

Fig. 76 Description:

- ① Decide temperature format
- ② Configure temperature thresholds and the monitor
- ③ Configure Fan speed thresholds and the monitor
- ④ Configure voltage thresholds and the monitor

4.7.9. UPS

Steps of enabling UPS support:

- (1) Go to “UPS” page
- (2) Enable UPS support in Fig. 77 ①
- (3) Select UPS model in Supported UPS List
- (4) Decide shutdown delay after AC power down.
- (5) Click **Confirm**

System Management > UPS

① Enable UPS Support

Supported UPS List

Select	UPS Name	Shutdown Delay (Minutes)
<input checked="" type="radio"/>	PCM_UPS-BNT-1000AP	② ③ 1

After the AC power fails for 1 minute(s), turn off the iSCSI Storage.

Confirm

Fig. 77 Configure UPS

Fig. 77 Description:

- ① Enable UPS support
- ② Select UPS model
- ③ Setup the shutdown delay when AC power down

4.7.10. Auto Logout

Steps of configuring auto logout function:

- (1) Go to “Logout Timer” Page
- (2) Decide auto logout delay
- (3) Click 

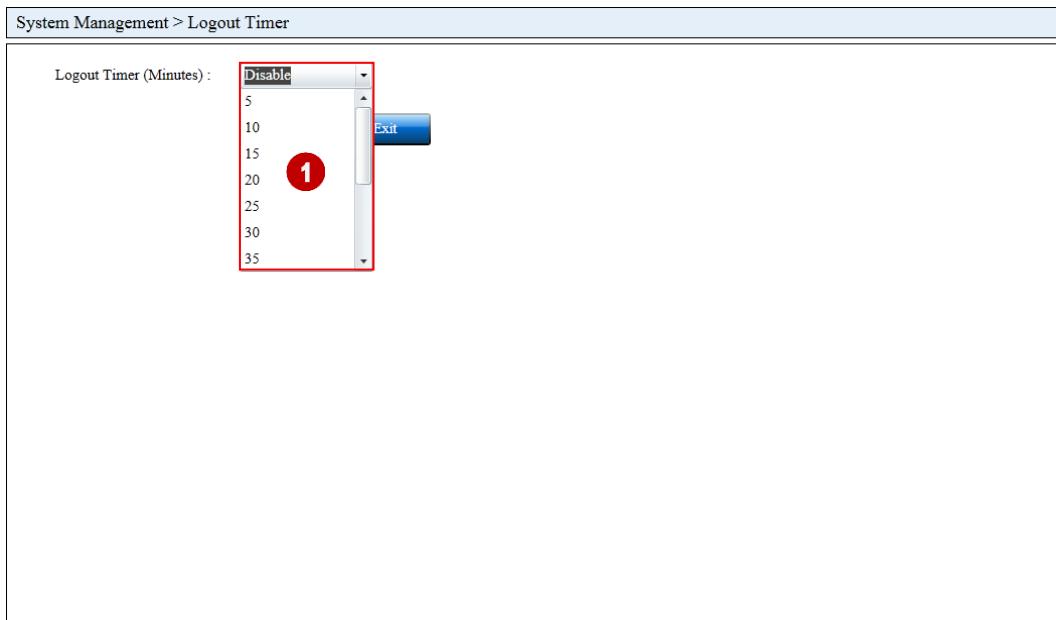

Fig. 78 Configure auto logout function

Fig. 78 Description:

- ① Choose auto logout function

4.7.11. Enable/Disable/Reset System Alarm

Steps of Configuring system alarm function:

- (1) Go to “Alarm” Page
- (2) Enable/Disable system alarm

Steps of reset system alarm:

- (1) Go to “Alarm” Page
- (2) Click 

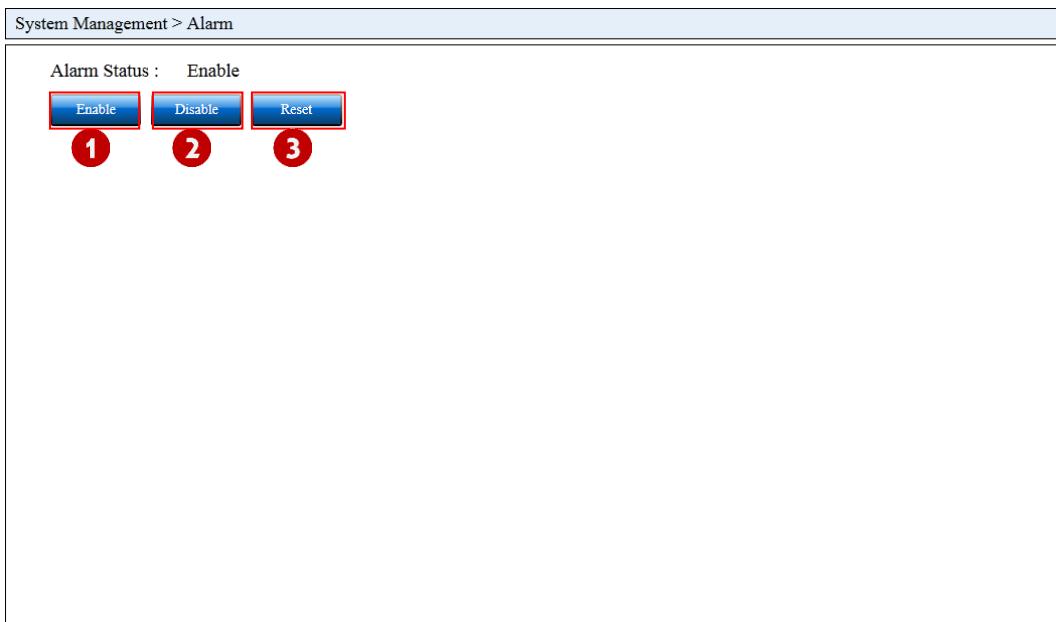

Fig. 79 Enable, Disable or Reset System Alarm

Fig. 79 Description:

- ① Enable System Alarm
- ② Disable System Alarm
- ③ Reset System Alarm when the system buzzer is sounding.

4.7.12. System Setting

4.7.12.1. Flow Control

Steps of enabling/disabling Flow Control Function:

- (1) Go to “System Setting” Page
- (2) Choose enable or disable flow control function
- (3) Click 

4.7.12.2. Read Ahead

Steps of enabling/disabling Read Ahead Function:

- (1) Go to “System Setting” Page
- (2) Choose enable or disable Read Ahead function
- (3) Click 

4.7.12.3. Enable/Disable SSH Connection

Steps of enabling/disabling SSH Connection:

- (1) Go to “System Setting” Page
- (2) Choose enable or disable SSH connection for remote maintenance
- (3) Click 

4.7.12.4. Enable/Disable Auto-Recovery

The RAID system would automatically and immediately recover all degraded RAID volumes when Administrator replaced the crashed HDD to a new one. Administrator can enable/disable this function by following steps:

- (1) Go to “System Setting” Page
- (2) Choose enable or disable RAID Auto-Recovery
- (3) Click **Confirm**

4.7.12.5. User Password Security

Steps of enabling/disabling User Password Security:

- (4) Go to “System Setting” Page
- (5) Choose enable or disable User Password Security
- (6) Choose locking policy (10 minutes, 24 hours, Forever)
- (7) Click **Confirm**

System Management > System Setting

Flow Control : Enable Disable

Read Ahead : Enable Disable

Allow SSH connection : Enable Disable

RAID Auto-Recovery : Enable Disable

User Password Security : **Forever**

Confirm **Exit**

Fig. 80 System Setting

4.8. System Maintenance

4.8.1. Version Information

- (1) Go to “Version Information” Page
- (2) Review the version

Fig. 81 Version information

4.8.2. System Upgrade

Steps of upgrading firmware:

- (1) Go to “Firmware Upgrade” Page
- (2) Browse upgrade file from your PC, which is running this UI
- (3) Check version in Fig. 82 ① and ②
- (4) Click

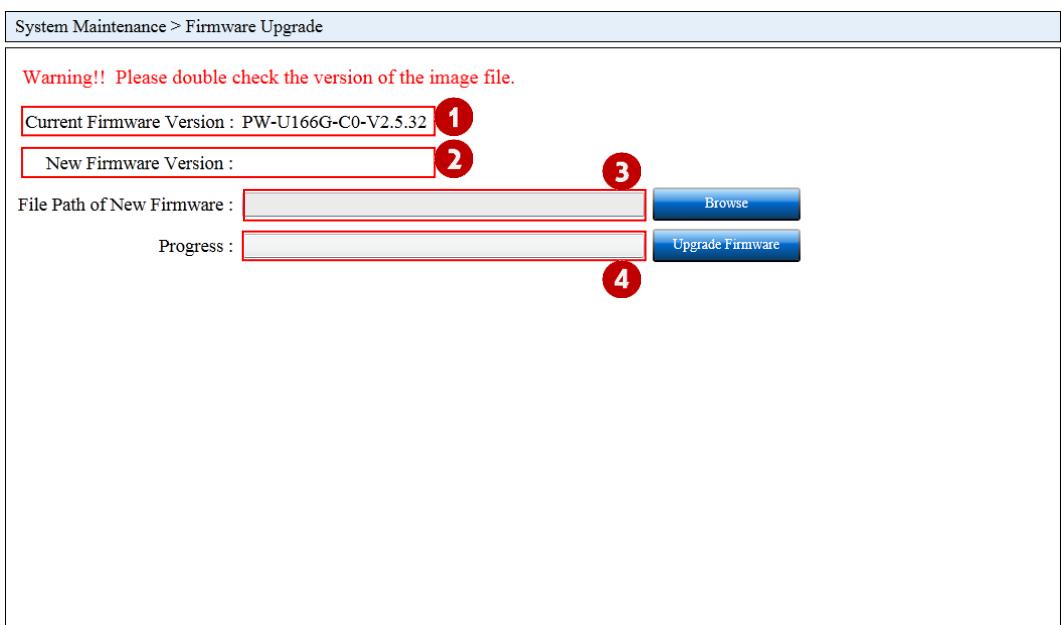

Fig. 82 System upgrade

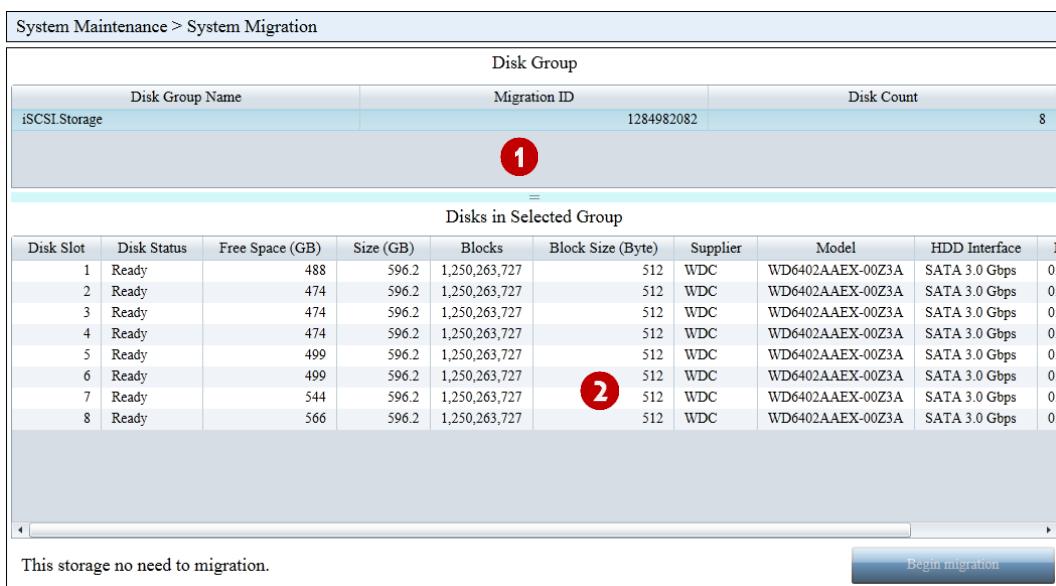

Fig. 82 Description:

- ① Current firmware version
- ② The selected firmware version
- ③ The path of new firmware file
- ④ The progress of upgrading firmware

4.8.3. System Migration

Steps of system migration:

- (1) Shutdown the old iSCSI storage
- (2) Remove all HDDs from the old iSCSI storage
- (3) Please make sure that all HDDs are OK.
- (4) Plug all HDDs in the new iSCSI storage
- (5) Boot the new iSCSI storage
- (6) Go to “System Migration” Page
- (7) Choose a set of HDDs in Fig. 83 ①
- (8) Click 

Disk Group								
Disk Group Name	Migration ID			Disk Count				
iSCSI Storage	1284982082			8				

Disks in Selected Group								
Disk Slot	Disk Status	Free Space (GB)	Size (GB)	Blocks	Block Size (Byte)	Supplier	Model	HDD Interface
1	Ready	488	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
2	Ready	474	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
3	Ready	474	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
4	Ready	474	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
5	Ready	499	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
6	Ready	499	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
7	Ready	544	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps
8	Ready	566	596.2	1,250,263,727	512	WDC	WD6402AAEX-00Z3A	SATA 3.0 Gbps

This storage no need to migration. 

Fig. 83 Select a set of HDDs in System Migration

Fig. 83 Description:

- ① The list of HDD sets
- ② The list of HDDs in a HDD set

4.9. AD Setting (Optional)

Steps of joining AD server:

- (1) Go to “AD Setting” page
- (2) Go to “Setting” page
- (3) Enable AD in Fig. 84 ①
- (4) Click 
- (5) Enter an account with Administrator privilege in the AD server, as shown in Fig. 85 ①.
- (6) Enter the account’s password
- (7) Enter the AD server’s IP address
- (8) Click 
- (9) Enter an account with Administrator privilege in the AD server, as shown in Fig. 84 ②
- (10) Enter the password of the account in Fig. 84 ③
- (11) Click 

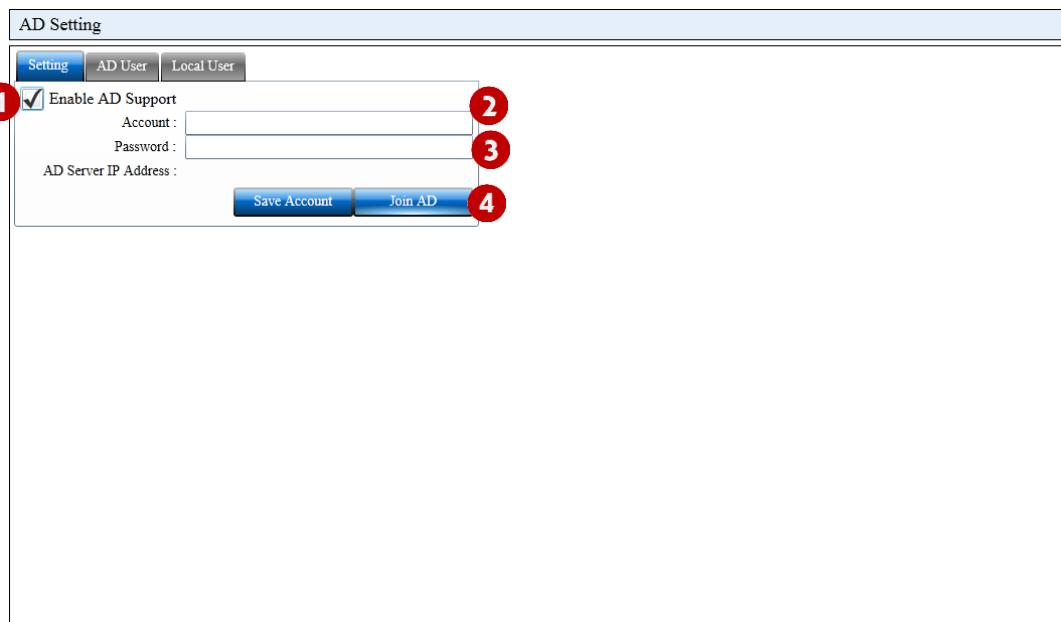

Fig. 84 This iSCSI Storage joins AD server

Fig. 84 Description:

- ① Enable AD function
- ② An account can get account list from AD server
- ③ The account's password
- ④ This iSCSI Storage joins AD server

Fig. 85 Enter account, password and AD server IP Address for joining AD server

Fig. 85 Description:

- ① Enter an account with Administrator privilege in the AD server

Steps of import accounts from an AD server:

- (1) Go to “AD Setting” page
- (2) Go to “AD User” page
- (3) Make sure that the iSCSI storage has joined in the AD server.
- (4) Go to “AD User” page
- (5) Click **List AD User Account** to obtain a user list from the AD server
- (6) Select users, whom you want to import
- (7) Click **Import To Local User** to import the selected users into the iSCSI storage

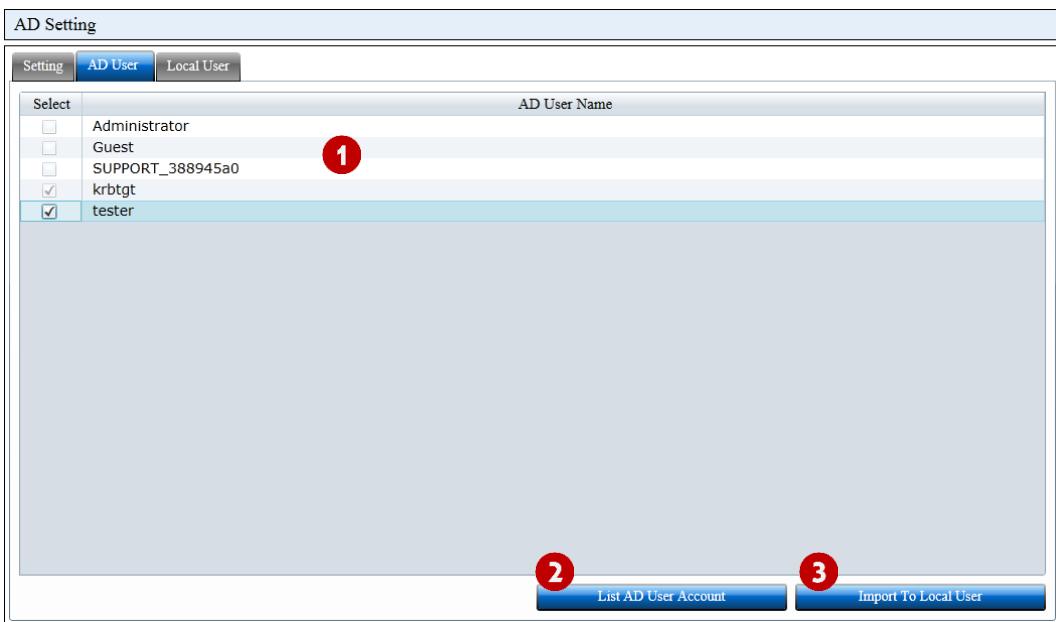

Fig. 86 List users from an AD server

Fig. 86 Description:

- ① The list of users in the AD server
- ② List users from the AD server
- ③ Import the selected users into the iSCSI storage

Steps of enable AD authorization for users:

- (1) Go to “AD Setting” page
- (2) Go to “Local User” page
- (3) Select some user without AD authorization
- (4) Click **Enable** to enable AD authorization for selected users

Steps of disable AD authorization for users:

- (1) Go to “AD Setting” page
- (2) Go to “Local User” page
- (3) Select some user with AD authorization
- (4) Click **Disable** to disable AD authorization for selected users

Remark: When a user is disabled AD authorization, the user's password is reset into “000000000000” (twelve 0).

AD Setting		
Setting	AD User	Local User
Select	User Name	AD Authorization
<input type="checkbox"/>	user01	Disable 1
<input type="checkbox"/>	user02	Disable
<input type="checkbox"/>	krbtgt	Enable
<input type="checkbox"/>	tester	Enable 2
3		4
Enable		Disable

Fig. 87 List local users and enable/disable AD authentication

Fig. 87 Description:

- ① The users without AD authorization
- ② The users with AD authorization
- ③ Enable AD authorization for selected users
- ④ Disable AD authorization for selected users

Remark: when users are authorized by AD server, please use IP SAN Connector to connect the iSCSI storage.

5. System Inquiry

5.1. I/O Throughput

5.1.1. Disk I/O Throughput Monitor

Steps of monitoring disk I/O throughput:

- (1) Click “iSCSI Storage Performance”
- (2) Go to “ Disk I/O” Page
- (3) Real Time Disk I/O throughput is shown in Fig. 88 ①.
- (4) The average Disk I/O throughput is shown in Fig. 88 ②.

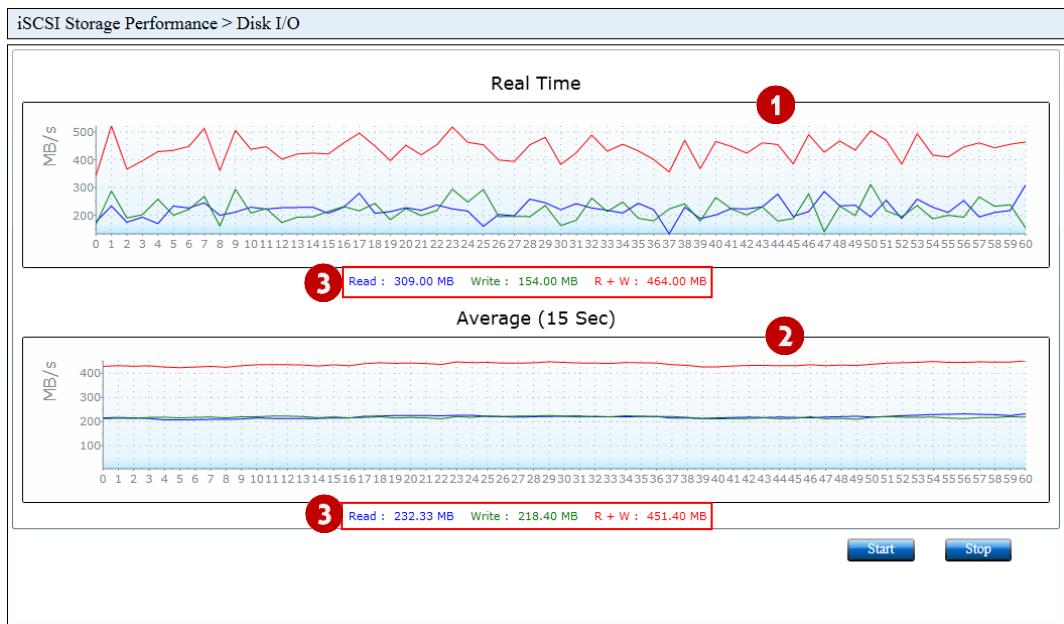

Fig. 88 Disk I/O Throughput

Fig. 88 Description:

- ① Real Time Disk I/O throughput
- ② Average Disk I/O throughput
- ③ Blue=Read throughput, Green=Write throughput, Red=Read+Write throughput

5.1.2. Individual Network Port Throughput

Steps of monitoring individual network port throughputs:

- (1) Click “iSCSI Storage Performance”
- (2) Go to “ Network - Individual” Page

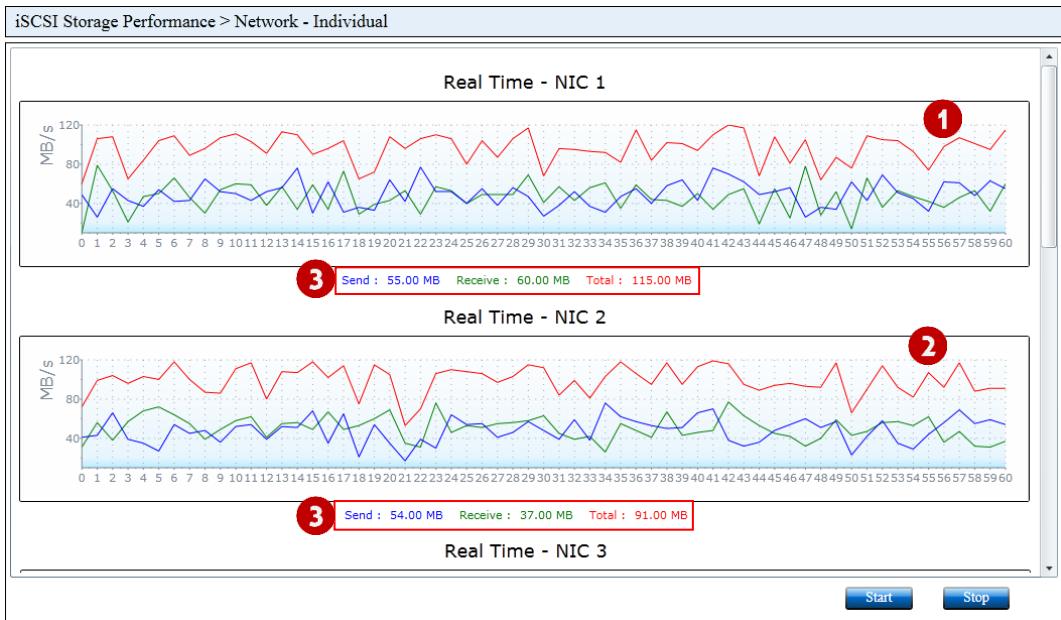

Fig. 89 Individual Network Throughput

Fig. 89 Description:

- ① NIC 1 Network throughput
- ② NIC 2 Network throughput
- ③ Blue=Send (Read) throughput, Green=Receive (Write) throughput, Red=Read+Write throughput

5.1.3. Network Total Throughput

Steps of monitoring total network throughput:

- (1) Click “iSCSI Storage Performance”
- (2) Go to “Network - Total” Page
- (3) Real Time Disk I/O throughput is shown in Fig. 90 ①.
- (4) The average Disk I/O throughput is shown in Fig. 90 ②.

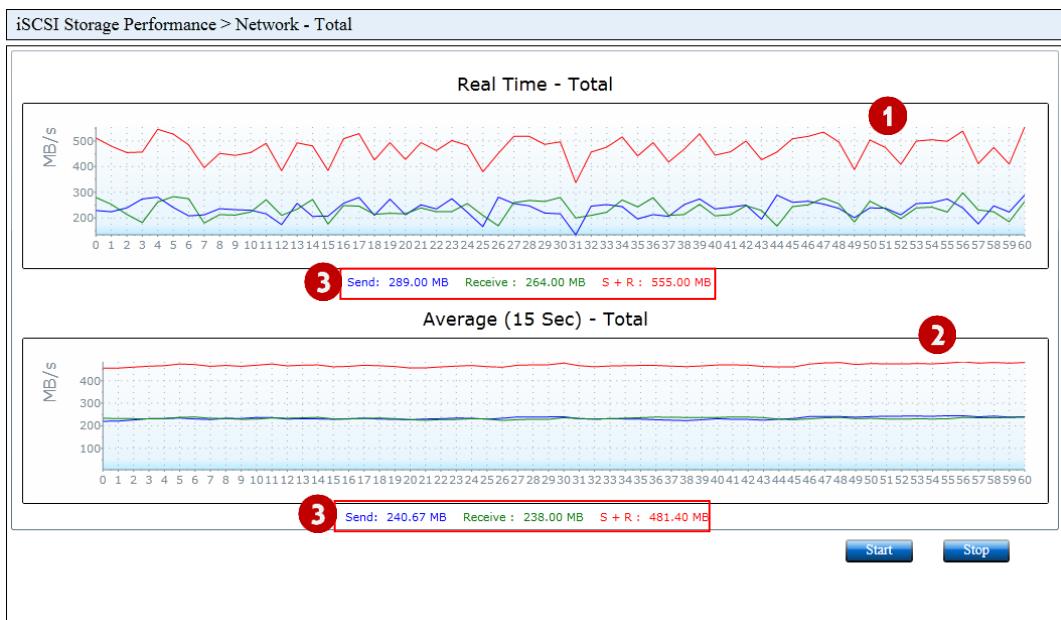

Fig. 90 Total Network Throughput

Fig. 90 Description:

- ① Real Time Total Network Throughput
- ② Average Total Network Throughput
- ③ Blue=Send (Read) throughput, Green=Receive (Write) throughput, Red=Read+Write throughput

5.2. Graphical HDD Status

Steps of monitoring HDDs by Graphic HDD status:

- (1) Click “Hard Disk Status”
- (2) Click a slot and then the LED of the slot will twinkle. The S.M.A.R.T. information of the HDD in the slot is illustrated in Fig. 91 ⑥.

Steps of shutting down this iSCSI Storage by “Hard Disk Status” page

- (1) Click “Hard Disk Status”
- (2) Click 
- (3) Confirm for shutting down this iSCSI Storage

Steps of rebooting this iSCSI Storage by “Hard Disk Status” page

- (4) Click “Hard Disk Status”
- (5) Click 
- (6) Confirm for rebooting this iSCSI Storage

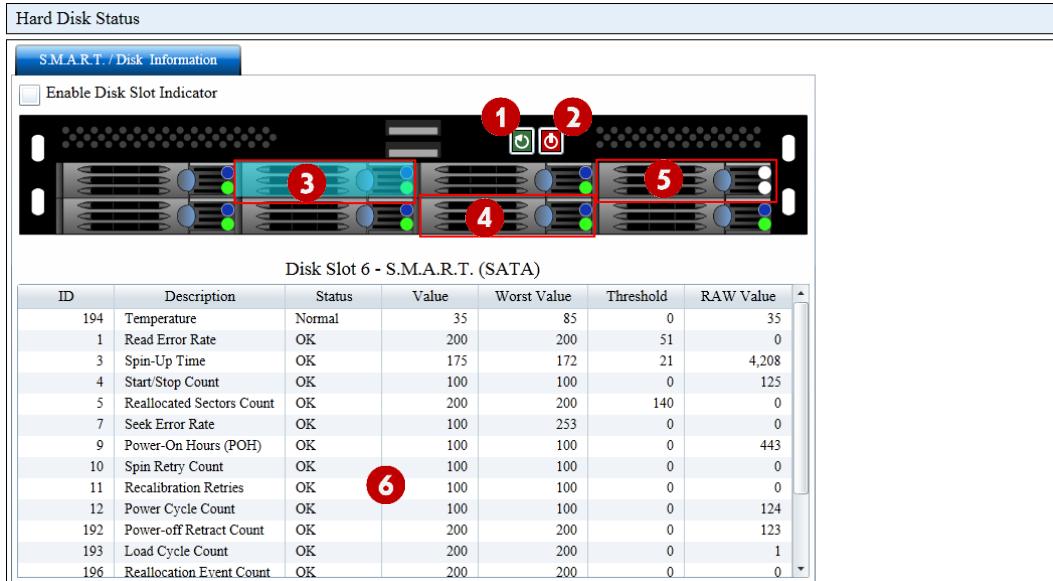

Fig. 91 Graphic HDD Status

Fig. 91 Description:

- ① Reboot this iSCSI Storage
- ② Shutdown this iSCSI Storage
- ③ Click a slot, then the LED of the slot is going to twinkle and the HDD's S.M.A.R.T. is illustrated in Fig. 91 ⑥.
- ④ A slot with a HDD
- ⑤ A slot without any HDD
- ⑥ S.M.A.R.T. Information or SAS Disk Information

5.3. System Environment Information

1. Status Bar

Administrator can quickly understand system statuses through Status Bar on UI, as shown in Fig. 92.

Fig. 92 The graphic system status

Icon	Function	Color	Status Description
	Power supply status		Power supply is OK
			Power supply fails
	RAID volume status		Each RAID volume is OK
			Some RAID volumes have some troubles.
	Fan status, including CPU fan speed and system fan speed.		All fans are OK.
			Some fans have troubles.
	Temperature, including CPU temperature and system temperature.		All temperatures are OK.
			Some temperatures are abnormal.
	Buzzer status		Buzzer is ON.
			Buzzer is OFF.
	Network port status		This network port is normal.
			This network port without an IP address.
			This network port without network cable.

Table 6 Graphic System Status Descriptions

2. Inquire System Environment Information

Steps of inquire system environment information:

- (1) Click “System Environment Information”
- (2) Inquire Motherboard Temperatures, CPU Temperatures, HDD Temperatures, CPU Fan speed, System Fan speed, Voltage and Power Supply.

System Environment Information		
Host System Environment Information		
1. System Temperature (°C / °F) :		
Item	Current Value	High Limit
Motherboard	30	60
CPU1	35	60
CPU2	35	60
Hard Disk (Slot 1)	30	55
Hard Disk (Slot 2)	29	55
Hard Disk (Slot 3)	29	55
Hard Disk (Slot 4)	30	55
Hard Disk (Slot 5)	30	55
Hard Disk (Slot 6)	29	55
Hard Disk (Slot 7)	30	55
Hard Disk (Slot 8)	30	55
Hard Disk (Slot 9)	30	55
Hard Disk (Slot 10)	31	55
Hard Disk (Slot 11)	30	55
Hard Disk (Slot 12)	30	55
Hard Disk (Slot 13)	31	55
Hard Disk (Slot 14)	30	55
Hard Disk (Slot 15)	30	55
Hard Disk (Slot 16)	30	55

Fig. 93 System Environment Information of This iSCSI Storage

5.4. User Information

Click “User Information” to show detail user information, as shown in Fig. 94.

User Information							
Drag a column here to group by that column							
User Name	Target Name	LUN Name	RAID Name	RAID Level	LUN ID	RAID ID	
admin	N/A	N/A		N/A	-1	-1	
anonymous	N/A	N/A		N/A	-1	-1	
Gamer	N/A	N/A		N/A	-1	-1

user04	t04.2	d04.2	TestRAID6	RAID 6	21	2	

Fig. 94 The table of user, iSCSI Target, iSCSI LUN and RAID level

Descriptions of columns in User Information Table:

① User Name

The existed usernames are in this iSCSI storage. If a username keeps N iSCSI LUNs, the username is presented N times in this table.

② Target Name

The existed iSCSI targets are in this iSCSI storage. If an iSCSI Target keeps N iSCSI LUNs, the iSCSI Target is presented N times in this table.

③ LUN Name

The existed iSCSI LUN names are in this iSCSI storage. An iSCSI LUN is only presented one time in this table.

④ RAID Name

Denote the RAID volume, which provides storage space to the iSCSI LUN.

⑤ RAID Level

Denote the RAID volume's level.

⑥ LUN ID

Denote the iSCSI LUN's ID number.

⑦ RAID ID

Denote the RAID volume's ID number.

5.5. User Online Status

Click "User Online Status" to show user online conditions, as shown in Fig. 95.

Online User Status					
Online User / Total User : 3 / 10 Online Connections / Maximum Connections : 3 / 100					
Username	Privilege	Online Status	Last Online Time	Adding Time	
vm	General	Online	2010/07/13 08:05:54	2010/07/07 08:26:21	①
user01	General	Online	None	2010/06/08 09:07:44	
user02	General	Online	None	2010/06/08 09:07:45	
admin	Administrator	Offline	None	None	
anonymous	General	Offline	None	None	
Gamer	General	Offline	2010/06/09 09:22:33	2010/06/08 09:12:18	②
upload	General	Offline	None	2010/06/10 13:45:47	
user03	General	Offline	None	2010/07/13 12:18:09	
user04	General	Offline	None	2010/07/13 12:18:09	
user05	General	Offline	None	2010/07/13 12:18:10	

Fig. 95 User Online Status

Fig. 95 Description:

- ① Online User
- ② Offline User
- ③ User Online Status List

Descriptions of columns in User Online Table:

① User Name

List all users in this iSCSI storage.

② Privilege

Denote a user's privilege, Normal or Administrator.

③ Online Status

Online Status	Description
Online	The user is using this iSCSI storage now.
Offline	The user has not connected to this iSCSI storage yet.

Table 7 User Online Status Description

④ Last Online Time

This column denotes the last online time of the user.

⑤ Adding Time

This column denotes when the user was created.

5.6. System Log

This iSCSI Storage provide 6 kinds of event logs as following:

1. Disk Event
2. RAID Event
3. Web Management Event
4. iSCSI Connection Event
5. Miscellaneous Event
6. User Log

5.6.1. Disk Event

Disk Event, as shown in Fig. 96, records all activities and conditions of disks. The follows are descriptions of the table's columns.

① Name

Name, meaning Event Name, denotes which component generates this event.

② Event

A string describes the event.

③ Time

Denote the time when this event happens.

System Log > Disk Event		
Name	Event	Time
Disk	R-00003: Hard Disk Attached Slot=1 (Disk ID=65)	2010/06/07 13:33:56
Disk	R-00002: Hard Disk Remove Slot=1 (Disk ID=65)	2010/06/07 11:45:05
Disk	R-00003: Hard Disk Attached Slot=13	2010/06/07 18:00:26
Disk	R-00003: Hard Disk Attached Slot=14 (Disk ID=47)	2010/06/07 18:00:25
Disk	R-00003: Hard Disk Attached Slot=15 (Disk ID=46)	2010/06/07 18:00:23
Disk	R-00003: Hard Disk Attached Slot=16 (Disk ID=45)	2010/06/07 18:00:22
Disk	R-00002: Hard Disk Remove Slot=14 (Disk ID=46)	2010/06/07 17:52:04
Disk	R-00002: Hard Disk Remove Slot=13 (Disk ID=45)	2010/06/07 17:52:04
Disk	R-00002: Hard Disk Remove Slot=15 (Disk ID=47)	2010/06/07 17:52:03
Disk	R-00014: Hard Disk Force Deleted Slot=16	2010/06/07 17:48:37
Disk	R-00002: Hard Disk Remove Slot=16 (Disk ID=0)	2010/06/07 17:48:37
Disk	R-00003: Hard Disk Attached Slot=16	2010/06/07 17:48:13
Disk	R-00003: Hard Disk Attached Slot=15	2010/06/07 17:48:12
Disk	R-00003: Hard Disk Attached Slot=14	2010/06/07 17:48:11
Disk	R-00003: Hard Disk Attached Slot=13	2010/06/07 17:48:07
Disk	R-00002: Hard Disk Remove Slot=16	2010/06/07 17:22:56
Disk	R-00002: Hard Disk Remove Slot=15	2010/06/07 17:22:55
Disk	R-00002: Hard Disk Remove Slot=14	2010/06/07 17:22:53
Disk	R-00002: Hard Disk Remove Slot=13	2010/06/07 17:22:51

Fig. 96 Disk Events

5.6.2. RAID Event

RAID Event, as shown in Fig. 97, records all activities and conditions of RAID volumes. The

follows are descriptions of the table's columns.

① Name

Name, meaning Event Name, denotes which component generates this event.

② Event

A string describes the event.

③ Time

Denote the time when this event happens.

System Log > RAID Event		
Name	Event	Time
RAID	R-00010: RAID Recovery finish Name='TestRAID6' (Raid ID=2)	2010/07/06 19:31:54
RAID	R-00010: RAID Recovery finish Name='TestRAID5' (Raid ID=1)	2010/07/06 19:31:30
RAID	R-00010: RAID Recovery finish Name='TestRAID50' (Raid ID=3)	2010/07/06 19:13:40
RAID	R-00009: RAID Recovery start Name='TestRAID50' (Raid ID=3)	2010/07/06 18:28:21
RAID	R-00009: RAID Recovery start Name='TestRAID5' (Raid ID=1)	2010/07/06 18:28:21
RAID	R-00009: RAID Recovery start Name='TestRAID6' (Raid ID=2)	2010/07/06 18:28:21
RAID	R-00005: RAID Degrade Name='TestRAID5' (Raid ID=1)	2010/07/06 11:45:05
RAID	R-00005: RAID Degrade Name='TestRAID6' (Raid ID=2)	2010/07/06 11:45:05
RAID	R-00005: RAID Degrade Name='TestRAID50' (Raid ID=3)	2010/07/06 11:45:05
RAID	R-00008: RAID Init finish Name='TestRAID50' (Raid ID=3)	2010/07/06 11:36:34
RAID	R-00008: RAID Init finish Name='TestRAID6' (Raid ID=2)	2010/07/06 11:36:03
RAID	R-00007: RAID Init start Name='TestRAID50' (Raid ID=3)	2010/07/06 11:29:05
RAID	R-00007: RAID Init start Name='TestRAID6' (Raid ID=2)	2010/07/06 11:28:26
RAID	R-00008: RAID Init finish Name='TestRAID5' (Raid ID=1)	2010/07/06 11:20:37
RAID	R-00007: RAID Init start Name='TestRAID5' (Raid ID=1)	2010/07/06 11:16:40

Fig. 97 RAID Events

5.6.3. Web Management Event

Web Management Event, as shown in Fig. 98, records all activities and conditions of web UI. The follows are descriptions of the table's columns.

① Name

Name, meaning Event Name, denotes which component generates this event.

② Storage IP

Denote an IP address of Administrator using to manage this iSCSI storage.

③ Client IP

Denote an IP address, which Administrator's PC used.

④ Event

A string describes the event.

⑤ Time

Denote the time when this event happens.

System Log > Web Management Event

Fig. 98 Web Management Events

5.6.4. iSCSI Connection Event

iSCSI Connection Event, as shown in Fig. 99, records all activities and conditions of iSCSI Target. The follows are descriptions of the table's columns.

① Name

Name, meaning Event Name, denotes which component generates this event.

② Storage IP

Denote an IP address of an iSCSI initiator using to connect to this iSCSI storage.

③ Client IP

Denote an IP address which user's PC used.

④ Event

A string describes the event.

⑤ Time

Denote the time when this event happens.

Fig. 99 iSCSI Connect Events

5.6.5. Miscellaneous Event

Miscellaneous Event, as shown in Fig. 100, records all activities and conditions of iSCSI Storage. The follows are descriptions of the table's columns.

① Name

Name, meaning Event Name, denotes which component generates this event.

② Event

A string describes the event.

③ Time

Denote the time when this event happens.

System Log > Miscellaneous Event		
Name	Event	Time
System	H-20004: System Alarm Once Off	01/25/2010 09:11:17
System	H-20002: System Alarm On	01/22/2010 16:42:51
System	H-20003: System Alarm Off	01/22/2010 16:42:48
System	H-20002: System Alarm On	01/22/2010 16:42:46
System	H-20004: System Alarm Once Off	01/20/2010 08:36:09
System	H-20004: System Alarm Once Off	01/19/2010 16:35:28
System	H-20004: System Alarm Once Off	01/19/2010 08:56:19
System	H-20002: System Alarm On	01/19/2010 08:56:16
System	H-20003: System Alarm Off	01/19/2010 08:55:20
System	H-20004: System Alarm Once Off	01/13/2010 11:16:56

Fig. 100 Miscellaneous Events

5.6.6. User Log

User Log, as shown in Fig. 101, records all activities and conditions of user. The follows are descriptions of the table's columns.

① Name

Name denotes a user, who generates this event.

② Storage IP

The user connects to the IP address of iSCSI Storage.

③ Clinet IP

The client's IP.

④ Event

A string describes the event

5 Time

Denote the time when this event happens

6. Exception Handling

6.1. Delete Disk Forcely

Steps of deleting disks forcedly:

- (1) Go to “Delete Disk Forcely” page.
- (2) Select a HDD, such as Disk Slot 7 is selected in Fig. 102.
- (3) Click 

Delete Disk Forcely										
<input type="checkbox"/> Enable Detail Information		<input type="checkbox"/> Enable Disk Slot Indicator								
Select <input type="checkbox"/>	Disk Slot	Disk Status	Volume (GB)	Free Space (GB)	Supplier	HDD Interface	Model	F/W Rev.	Blo	▲
<input type="checkbox"/>	1	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	2	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	3	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	4	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	5	Ready	596.2	513	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	6	Ready	596.2	513	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	7	Ready	596.2	558	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	8	Ready	596.2	580	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	

Fig. 102 Delete Disk Forcely

Steps of resetting deleted disk status:

- (1) Go to “Delete Disk Forcely” page.
- (2) Select a deleted slot, such as Slot 7 is “Deleted Disks” status in Fig. 103.
- (3) Click 

Delete Disk Forcibly										
<input type="checkbox"/> Enable Detail Information		<input type="checkbox"/> Enable Disk Slot Indicator								
Select <input type="checkbox"/>	Disk Slot	Disk Status	Volume (GB)	Free Space (GB)	Supplier	HDD Interface	Model	F/W Rev.	Blo	▲
<input type="checkbox"/>	1	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	2	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	3	Ready	596.2	488	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	4	Deleted Disk	0	0						
<input type="checkbox"/>	5	Ready	596.2	513	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	
<input type="checkbox"/>	6	Ready	596.2	513	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2

<input type="checkbox"/>	8	Ready	596.2	580	WDC	SATA 3.0 Gbps	WD6402AAEX-00Z3A	05.0	1,250,2	

Fig. 103 Reset Deleted Disk Status

7. User Management Page

7.1. User Login

Steps of first time to log on user management page:

- (1) Connect to iSCSI Storage by a web browser, such as IE.
- (2) Enter your username (not “admin”), as shown in Fig. 104.
- (3) Enter your password
- (4) Change your password, as show in Fig. 105.
- (5) Enter the old password
- (6) Enter a new password
- (7) Enter the new password again
- (8) Click **Confirm**

Fig. 104 Login User Management Page

Fig. 104 Description:

- ① Select “iSCSI Storage Login”
- ② Username (not “admin”)
- ③ Password

Change Password

Change Password

User Name : user01

Current Password : ①

New Password : ②

Confirm New Password : ③

Confirm

Fig. 105 Change a user's password

Fig. 105 Description:

- ① Enter the older password
- ② Enter a new password
- ③ Enter the new password again

7.2. Modify Alias

7.2.1. Modify Target Alias

Steps of modifying iSCSI Target aliases:

- (1) Go to “Modify Alias” Page
- (2) Go to “Modify Target Alias” Page
- (3) Click of an iSCSI Target
- (4) Enter a new alias
- (5) Click

Modify Alias				
Modify Target Alias		Modify LUN Alias		
Action	Target Alias	Target Name	Description	Adding Time
Modify Alias	t01.1	t01.1		2010/06/08 09:07:44
Modify Alias	t01.2	t01.2		2010/06/08 09:07:45
Modify Alias	share.t01	share.t01		2010/07/12 10:50:15

Fig. 106 Modify iSCSI Target Alias

7.2.2. Modify LUN Alias

Steps of modifying iSCSI LUN aliases:

- (1) Go to “Modify Alias” Page
- (2) Go to “Modify LUN Alias” Page
- (3) Click of an iSCSI Target
- (4) Enter a new alias
- (5) Click

Modify Alias					
Modify Target Alias		Modify LUN Alias			
Action	LUN Alias	LUN Name	Description	Adding Time	Target Name
Modify Alias	d01.1	d01.1		2010/07/13 12:18:07	t01.1
Modify Alias	d01.2	d01.2		2010/07/13 12:18:07	t01.1
Modify Alias	d01.3	d01.3		2010/07/13 12:18:08	t01.1
Modify Alias	d01.4	d01.4		2010/07/13 12:18:08	t01.2
Modify Alias	d01.5	d01.5		2010/07/13 12:18:08	t01.2

Fig. 107 Modify iSCSI LUN Alias

7.3. Review a User's iSCSI Targets

Step of reviewing user's iSCSI Targets:

- (1) Go to "Target Information" Page
- (2) Select an iSCSI Target
- (3) Review the iSCSI Target and iSCSI LUNs of the iSCSI Target

Target Information				
Target Information			LUN Information	
Target Alias	Target Name	Access IP	LUN Alias	LUN Name
t01.1	t01.1	None	d01.1	d01.1
t01.2	t01.2	None	d01.2	d01.2
share.t01	share.t01	None	d01.3	d01.3

Fig. 108 Review a user's iSCSI Targets

7.4. User Log

User Log, as shown in Fig. 109, records all activities and conditions of user. The follows are descriptions of the table's columns.

① Name

Name denotes a user, who generates this event.

② Storage IP

The user connects to the IP address of iSCSI Storage.

③ Clinet IP

The client's IP.

④ Event

A string describes the event.

⑤ Time

Denote the time when this event happens.

User Log

8. IP SAN Connector

8.1.1. Download and Install IP SAN Connector

Steps of downloading IP SAN Connector (IPSC):

- (1) Connect to iSCSI Storage Login Page or Easy IP SAN Page
- (2) Click “Download IP SAN Connector” hyperlink
- (3) Execute the downloaded file, IP_SAN_Connector.exe. The file will be decompressed in a folder, named IP_SAN_Connector.
- (4) Open the folder and execute setup.exe.
- (5) A shortcut, IPSC, is created on your Desktop.

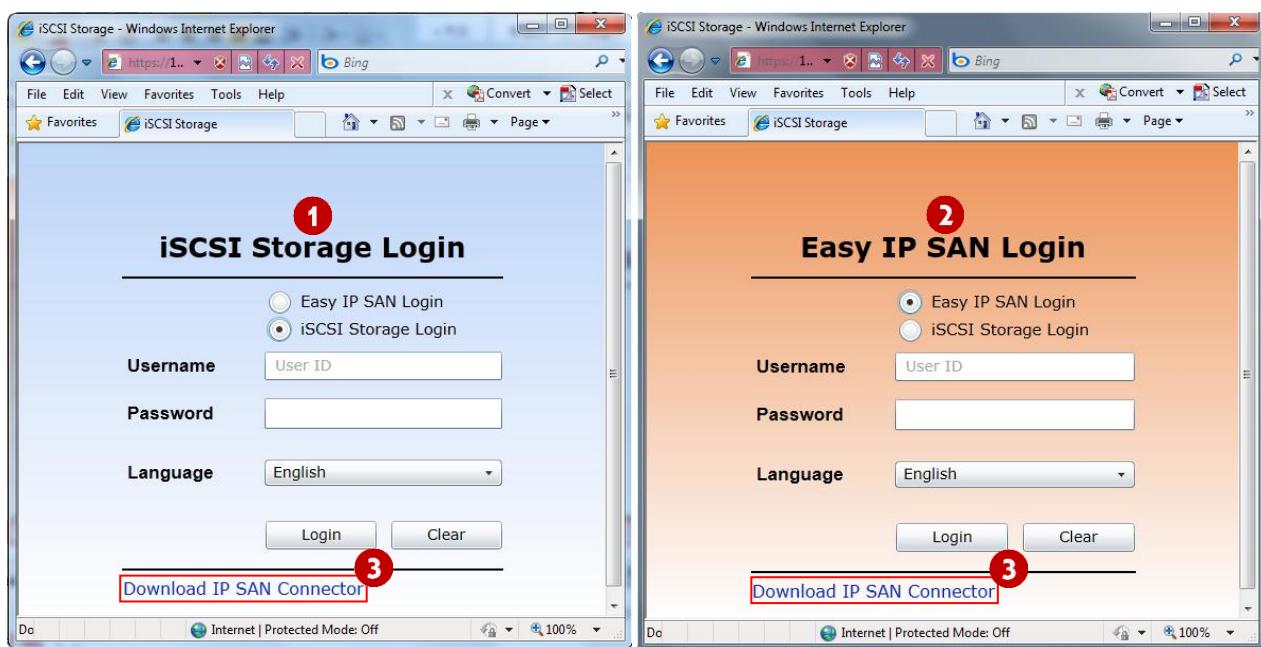

Fig. 110 Hyperlink of downloading IP SAN Connector

Fig. 110 Description:

- ① Login Page of iSCSI Storage
- ② Login Page of Easy IP SAN
- ③ Hyperlink of downloading IP SAN Connector (IPSC)

8.1.2. IP SAN Connector

Steps of connecting to iSCSI storage by IP SAN Connector:

- (1) Execute the shortcut, IPSC, on your Desktop, as shown in Fig. 111 ①
- (2) Select your Language (optional)
- (3) Enable/disable AD authorization (optional)
- (4) Enable/disable “Cross Internet” (optional). If your PC connects to an iSCSI storage cross Internet, it is better to enable “Cross Internet”
- (5) Enter the IP address of iSCSI storage
- (6) Enter username
- (7) Enter password
- (8) Click **Mount**

(9) IPSC is connecting to the iSCSI Storage, as shown in Fig. 112

(10) Successfully connect to an iSCSI storage, as shown in Fig. 113.  becomes 

Fig. 111 IP SAN Connector and its shortcut

Fig. 111 Description:

- ① The icon of IPSC
- ② The UI of IPSC
- ③ Select Language
- ④ Enable/disable AD authentication
- ⑤ If your PC accesses the iSCSI Storage via Internet, it is better to enable “Cross Internet”.
- ⑥ IP Address of an iSCSI Storage
- ⑦ Username
- ⑧ Password
- ⑨ Mount iSCSI Targets

Fig. 112 IPSC is connecting to an iSCSI Storage

Fig. 113 Successfully Connect to an iSCSI storage

9. Easy IP SAN

9.1. Login Easy IP SAN Management

Steps of logging on Easy IP SAN management:

- (1) Select “Easy IP SAN Login” on the login page, as shown in Fig. 114
- (2) Enter “admin”
- (3) Enter admin’s password

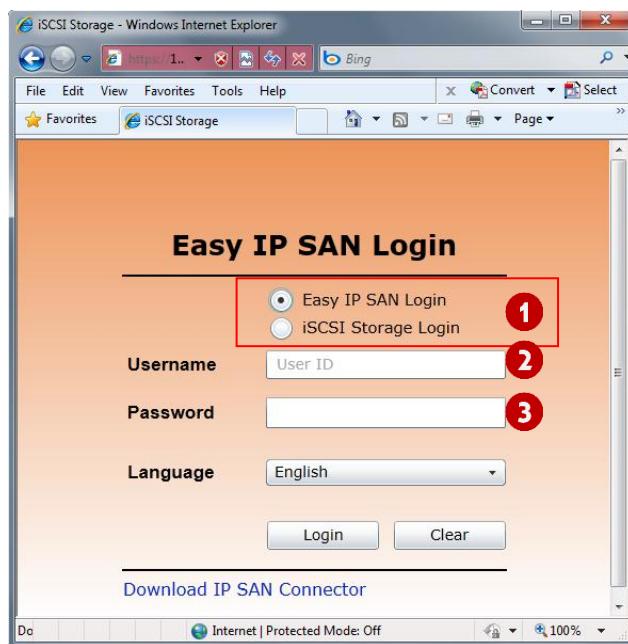

Fig. 114 Login page of Easy IP SAN management

Fig. 114 Description:

- ① Please select “Easy IP SAN Login”
- ② Enter “admin”
- ③ Enter admin’s password

9.2. Add Easy IP SAN Members

Steps of adding an iSCSI storage into an Easy IP SAN:

- (1) Go to “Add IP SAN Member” page
- (2) Enter an IP address of iSCSI storage in Fig. 115 ②
- (3) Click  to add the iSCSI storage into the Easy IP SAN

Easy IP SAN Management > Add IP SAN Member

Add IP SAN Member	
Select	IP of iSCSI Storage
<input type="checkbox"/>	192.168.88.181
Input IP Address : <input type="text" value="192.168.88.241"/> 2	
<input type="button" value="Add"/>	

Fig. 115 Add a new iSCSI storage into Easy IP SAN

Fig. 115 Description:

- ① The members of this Easy IP SAN
- ② Enter a new iSCSI storage's IP address and then click to add the iSCSI storage into the Easy IP SAN

9.3. Remove Members from Easy IP SAN

Steps of removing an iSCSI storage from Easy IP SAN:

- (1) Go to “Delete IP SAN Member” page
- (2) Select iSCSI storages, you want to remove from the Easy IP SAN.
- (3) Click

Easy IP SAN Management > Delete IP SAN Member

Delete IP SAN Member	
Select	IP of iSCSI Storage
<input type="checkbox"/>	192.168.88.181
<input checked="" type="checkbox"/>	192.168.88.241
<input type="button" value="Delete"/>

Fig. 116 Description:

- ① The selected iSCSI storage, which will be removed from the Easy IP SAN

9.4. Review Easy IP SAN Members

Steps of reviewing iSCSI storages:

- (1) Go to “IP SAN Member” page
- (2) Click these hyperlinks for connecting to individual management systems of iSCSI storages

Select	IP of iSCSI Storage	
<input type="checkbox"/>	192.168.88.181	Click to Connect
<input type="checkbox"/>	192.168.88.241	Click to Connect

Fig. 117 Show iSCSI storages of Easy IP SAN

Fig. 117 Description:

- ① The hyperlinks for connecting to individual management systems of iSCSI storages
- ② The list of iSCSI storages

9.5. Performance Monitor of Easy IP SAN

Steps of monitoring Easy IP SAN performance:

- (1) Go to “IP SAN Performance” Page
- (2) Real Time Disk I/O throughput is shown in Fig. 118 ①.
- (3) The average Disk I/O throughput is shown in Fig. 118 ②.

Fig. 118 Performance Monitor of Easy IP SAN

Fig. 118 Description:

- ① Real Time Disk I/O throughput
- ② Average Disk I/O throughput
- ③ Blue=Send (Read) throughput, Green=Receive (Write) throughput, Red=Read+Write throughput
